CASE DEFINITION**CYSTICERCOSIS (CDPH, working definition 2011)****CLINICAL DESCRIPTION**

Cysticercosis is a tissue infection with the larval stage of the pork tapeworm, *Taenia solium*. When tapeworm eggs or proglottids are swallowed, the hatching eggs release larvae which can migrate from the intestine into tissues (including muscle, organs, or central nervous system (CNS) where they form cysts or cysticerci). Cysticerci in the CNS can manifest clinically as headache, epileptiform seizures, signs of intracranial hypertension, or psychiatric disturbances.

LABORATORY / IMAGING CRITERIA FOR DIAGNOSIS

Confirmed:

- *T. solium* identified in excised cysticerci from tissues by microscopic examination; OR
- Identification of cysticerci by CT scan, MRI, or X-ray AND positive result on CDC immunoblot assay.

Supportive:

- Identification of calcified cystic lesions in tissue by CT scan, MRI, or X-ray; OR
- Positive result on CDC immunoblot assay.

CASE CLASSIFICATION

Confirmed: A clinically compatible case that is laboratory confirmed.

Probable: A clinically compatible case that has supportive laboratory evidence.

Suspected: A clinically compatible case without laboratory evidence that is epidemiologically associated with a Probable or Confirmed case.

TAENIASIS (CDPH, working definition 2011)**CLINICAL DESCRIPTION**

A parasitic disease characterized by an intestinal infection with the adult stage of large tapeworms (*Taenia solium* and *Taenia saginata*). Clinical manifestations are variable and may include nervousness, insomnia, anorexia, weight loss, abdominal pain, and digestive disturbances. Many cases are asymptomatic.

LABORATORY CRITERIA FOR DIAGNOSISConfirmed: Identification of *Taenia* scolex, proglottids, or eggs in feces.**CASE CLASSIFICATION**

Confirmed: A case that meets the laboratory criteria for diagnosis.
