The Centers for Disease Control and Prevention (CDC) issued a health advisory today regarding *Brucella* RB51 exposures from consuming raw milk. The CDC reports on three confirmed cases of brucellosis from *Brucella* RB51 as well as exposures in 19 states, including California.

The full CDC communication is on next page and [online](http://publichealth.lacounty.gov/lanhan).

Local confirmed and suspected cases of human brucellosis should be reported immediately by phone to Public Health.

**Los Angeles County DPH Acute Communicable Disease Control:**
- Weekdays 8:30 AM – 5 PM: call 888-397-3993.
- After-hours: call 213-974-1234 and ask for the physician on call.
- For consultation: call 213-240-7941.

**Long Beach Health and Human Services:**
- Weekdays 8 AM – 5 PM: call 562-570-4302.
- After-hours: call the Duty Officer at 562-500-5537.

**Pasadena Public Health Department:**
- Weekdays 8 AM – 5 PM (closed every other Friday): call 626-744-6089.
- After-hours: call 626-744-6043.

Third Case of Rifampin/Penicillin-Resistant Strain of RB51
*Brucella* from Consuming Raw Milk

**Summary**

The New York State Department of Health and Pennsylvania Department of Health are investigating *Brucella* RB51 exposures that may be connected to consuming raw (unpasteurized) milk from Miller’s Biodiversity Farm in Quarryville, Pennsylvania. Symptoms of brucellosis can include fever, sweats, malaise, anorexia, headache, fatigue, muscle and joint pain, and potentially more serious complications (e.g., endocarditis, hepatomegaly, splenomegaly, and neurologic symptoms). In pregnant patients, *Brucella* infections can be associated with miscarriage. Symptom onset can occur anywhere from five days to six months following exposure. As of January 22, 2019, exposures have been identified in 19 states: Alabama, California, Connecticut, Florida, Georgia, Iowa, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, New Jersey, New York, North Carolina, Ohio, Pennsylvania, Rhode Island, South Carolina, and Virginia.

**Background**

This investigation is associated with the third known case of brucellosis from *Brucella* RB51 due to raw milk acquired in the U.S., since August 2017. A New York resident, who drank raw milk purchased from Miller’s Biodiversity Farm in Quarryville, Pennsylvania, was diagnosed with brucellosis in November 2018. Milk samples from the dairy tested positive for *Brucella* strain RB51. People who consumed raw milk or raw milk products from this dairy since January 2016 may have been exposed.

- Patients who are still **within six months** of the date they last consumed the raw milk are at an increased risk for brucellosis and appropriate post-exposure prophylaxis (PEP) is recommended, along with six months of symptom monitoring. Please see diagram below.
- If patients are **outside of the six-month window** following their last consumption of the raw milk and have or develop an illness consistent with brucellosis, a blood culture should be obtained prior to starting any treatment, preferably while the patient is symptomatic.

*Brucella* strain RB51 is a live-attenuated cattle vaccine strain, which can be shed in milk and can cause infections in humans. RB51 is resistant to rifampin and penicillin. There is no serological test available to detect RB51 infection. Blood culture is the recommended diagnostic test for exposed individuals who are symptomatic.¹

**Recommendations**

The Centers for Disease Control and Prevention (CDC) recommends the following:

1. A 21-day course of both doxycycline and trimethoprim/sulfamethoxazole for first-line PEP for RB51 exposure.² If brucellosis occurs despite prophylaxis, treatment should be pursued; alternative options should be considered for those with contraindications to the stated PEP and treatment regimens.² Please note that RB51 is resistant to rifampin and penicillin.
2. When ordering blood cultures to diagnose brucellosis, please advise the laboratory that blood culture may grow *Brucella* and that appropriate laboratory containment and precautions should be observed.³
3. Advise patients to discard any leftover or stored, raw milk or raw milk products from this dairy farm.
Please see the diagram below for information on developing an evaluation and treatment plan for patients who consumed raw milk or raw milk products from Miller’s Biodiversity Farm since January 2016, and are still within the six-month window following their last known exposure.

Treatment Decision Tree for Patients Who Consumed Raw Milk or Raw Milk Products from Miller’s Biodiversity Farm in Quarryville, Pennsylvania

Exposed?

- Yes
  - Symptomatic?
    - Yes
      - Blood culture result?
        - Positive for Brucella RB51
          - Appropriate antibiotic treatment
        - Negative for Brucella RB51
          - 21 days of PEP AND Complete 6 months of symptom watch
    - No
      - 21 days of PEP AND Complete 6 months of symptom watch
  
- No
  - No treatment or PEP for RB51 indicated

Note: Testing for asymptomatic patients is not recommended.
