Introduction

The 2007 Los Angeles County Health Survey (LACHS) was commissioned by the Los Angeles County Department of Public Health and conducted by Field Research Corporation (Field), an independent California-based opinion research organization. Founded in 1945 by Mervin Field, Field is one of the oldest and most respected full-service opinion research firms with headquarters in the Western United States. Field specializes in conducting surveys in the areas of health, public policy and social research among national, state, regional and local populations, as well as among special populations.

The 2007 LACHS expanded upon four previous LACHS studies conducted for the County by Field in 1997, 1999-2000, 2002-2003 and 2005. The overall objectives of each LACHS have been to provide the County with accurate and reliable measurements tracking health status, health conditions, access to care, use of preventive health services, and health-related behaviors among the populations of Los Angeles County adults and children. The survey also enables the County to collect and analyze information on a wide range of other health and health policy topics to provide health planners, policymakers, community leaders and ultimately the public itself with information that bear on the health of County residents.

The sample sizes of each LACHS are large enough to enable the survey results to be projectable countywide and within a wide array of regional, demographic and health-related subgroups of the County's adult and child populations.

Field was responsible for providing advice and assistance to the County in developing the survey questionnaires for both the Adult Survey and the Child Survey, translating them into five non-English languages, programming each version of the questionnaire onto Field's computer-assisted telephone interviewing (CATI) or its web-based MR Interviewer system, conducting pre-testing and pilot testing of the instruments, sampling, data collection, data processing, developing appropriate statistical weights and the delivery of data files and accompanying documentation to the County upon the study's completion.

Populations of Interest and Study Design

The LACHS is a population-based telephone survey of Los Angeles County households. It is structured to examine two separate and distinct populations within Los Angeles County. These populations include:

- ◆ Los Angeles County adults: The Adult Survey is a projectable countywide sampling of adults age 18 or older living in Los Angeles County. Households are selected using a random digit dial (RDD) sampling methodology. Within each household, interviews are conducted by telephone with one randomly selected adult. The 2007 LACHS included interviews with a total sample of 7,200 adults. This included 6,948 interviews completed among a countywide sample of adults and 252 interviews conducted as part of an augmented sample of adults living in the County's least populated Antelope Valley Service Planning Area (SPA).
- ◆ Los Angeles County children: The Child Survey is a projectable countywide sampling of Los Angeles County children ages 0-17. The survey is conducted by telephone with the child's parent or primary caregiver (typically the mother) who lives in the same household as the child. The 2007 survey included interviews with a countywide sample of 5,288 parents/caregivers, plus augmented samples of 238 parents/caregivers living in the county's Antelope Valley SPA and 202 parents/caregivers living in the county's West SPA. The samples of parents/caregivers interviewed as part of the Child Survey were developed from two sources.
 - Phase One: Phase One included follow-up interviews conducted in households that participated in the Adult Survey where a child age 0-17 resided. Follow-up interviews were completed with the same respondent if the survey respondent was the parent/caregiver of a child under in that household. In child households where the original adult interviewed as part of the Adult Survey was not the parent/caregiver, the name of the parent/caregiver was sought and callbacks were made to attempt to reach and interview that individual during a follow-up call. Data from households completing both the Adult Survey and Child Survey were linked in data processing to facilitate additional data analysis possibilities.

- Phase Two: Additional interviews with parents/caregivers in Phase Two were developed from a random digit dial (RDD) sampling of County households. Households reached through the RDD sampling process were screened for the presence of children under age 18. Once identified, the parent/caregiver of one of the children age 0-17 living in the household was interviewed.

Sample Frame

The sample frame for the 2007 LACHS included Los Angeles County households, defined as including all houses, apartments, and mobile homes occupied by individuals, families, multiple families or extended families or occupied by multiple unrelated persons with access to a residential (landline) telephone. Excluded from this definition are communes, convents, shelters, halfway houses or dormitories, institutionalized persons, such as those living in prisons, jails, juvenile detention facilities, psychiatric hospitals, military barracks, residential treatment programs and nursing homes for the disabled or aged, the homeless, as well as households without access to a landline telephone. Statistical weighting procedures were employed in the data processing phases of both the Adult Survey and the Child Survey to reduce any biases associated with the exclusion of households without telephones or without access to a landline telephone.

Sampling

Random samples of Los Angeles County households were generated using a random digit dial (RDD) sampling methodology. For the 2007 LACHS, as was the case for each prior LACHS conducted by Field, samples of RDD telephone listings were purchased from Survey Sampling, Inc. (SSI), a leading supplier of telephone samples to the survey research industry. The specific sampling product purchased was SSI's "Random A" sample for Los Angeles County.

Survey Sampling's "Random A" sample consists of a single-stage, equal probability sample systematically selected from all eligible 10-digit telephone numbers assigned to the county. The sampling frame for LACHS consisted of all possible numbers in active blocks of 100 telephone numbers. All county numbers are grouped into blocks of 100 telephone numbers, each sharing

the same first 8 digits. For example, the telephone number 555-708-6677 is made up of the area code 555, the telephone exchange 708, and the last four digits 6677. This would fall into the 100-block 555-708-6600 through 555-708-6699.

Only those 100-blocks that were found to have at least 3 directory-listed numbers were eligible for inclusion in the LACHS sampling frame. Business phone numbers identified from the Dun and Bradstreet and InfoUSA Yellow Page databases were included in the sampling frame, but were not eligible for selection.

For 2007, Los Angeles County had 76,079 100-blocks. Each had 100 possible/eligible numbers for a frame total of 7,607,900 possible/eligible numbers. To randomly select which numbers would be dialed, a sampling interval (I) was calculated by dividing the number of eligible units (N) by the desired number of sample units (n). A random number (r) between zero and one was generated and multiplied by the sampling interval to calculate a random starting point K(1) between one and the sampling interval. (e.g.)

$$N=7607900$$

$$n=40000$$

$$I = (N/n) = (7607900/40000) = 190.1975$$

$$r=.2049525847$$

$$k(1) = Ir = 38.6871$$

When accumulation reached the random starting point, the unique 10-digit telephone number represented by that point was selected and written to the sample file. The next sampling point $[k(n+1) = k(n)+I]$ was then determined, and accumulation of sampling units (or telephone numbers) continued until the next sampling point was reached. Telephone numbers, each representing a unique Primary Sampling Unit, were systematically selected in this fashion until the required number of sampling units was achieved. (e.g.)

$$k(1) = Ir = 38.6871$$

$$k(2) = k(1) + I = 38.6871+190.1975 = 228.8846$$

$$k(3) = k(2) + I = 228.8846+190.1975 = 419.0621$$

$$\dots k(40000)$$

Augmented samples of RDD listings developed for the Adult Survey in the County's Antelope Valley SPA and for the Child Survey in the County's Antelope Valley or West SPAs were also purchased from Survey Sampling, Inc.'s Random A sample file, but were limited to the telephone exchanges serving only those cities, towns and zip codes within each specified SPA.

Questionnaire Development

Two questionnaires were developed for the 2007 LACHS, one for the Adult Survey and a second for the Child Survey. Many of the questions used in each survey were taken verbatim from previous LACHS studies or from other established state and national health surveys to permit direct comparisons or trend assessments over time. In addition, as was the case in each previous LACHS, new questions were developed to meet the Public Health Department's evolving opinion research needs.

County staff persons were responsible for the initial development of both the Adult Survey and Child Survey questionnaires. However, Field provided input and assistance to the County throughout the questionnaire development period, including advice on question wording, the sequencing of items, the creation of skip patterns or go-to sequences, as well as other matters relating to the development and finalization of each questionnaire. Field's overriding objective in this phase was to maintain an internal structure and coherence to the questioning to facilitate easy administration by telephone, to enhance respondent cooperation, and to ensure the meaningfulness and validity of survey responses. This questionnaire development phase involved numerous iterations of draft survey instruments exchanged between the County and Field before a penultimate survey instrument was deemed ready for preliminary testing.

Structure and Content of the Adult Survey Questionnaire

The following is a summary of the structure and general content areas of the 2007 Adult Survey questionnaire.

Adult Survey Screener

The Adult Survey included an initial series of screening questions devised to identify eligible households in the County and select one adult within each household to interview.

In the initial dialing of RDD telephone numbers, the interviewer first sought to ascertain whether the number dialed was in fact a household. Once a household was contacted, the interviewer introduced himself or herself to the household spokesperson and described the overall purposes of the call and its sponsorship. The survey screener then posed a number of specific questions to determine the eligibility of the household for the Adult Survey. The content of these questions sought to:

1. Verify that the household was located within Los Angeles County
2. Ascertain whether one or more adults age 18 or older lived in the household
3. Randomly select one adult age 18 or older to interview for the survey using a systematic respondent selection procedure.
4. Determine the preferred language of approach for that adult

If the randomly selected adult was someone other than the household spokesperson initially contacted, the interviewer re-introduced himself or herself to this other adult, reviewing once again the overall purposes of the call and its sponsorship. Other pertinent information about the survey was provided at this time, as necessary, including the fact that their household's telephone number had been randomly generated by computer, that the survey was confidential, and that all answers given would not be identified with them or their household in any way. Upon request, respondents were also provided with the telephone number at Field and/or the County Health Department to verify the authenticity of the survey or seek additional information.

Respondent Selection Procedures

Field employed a probabilistic respondent selection procedure that minimizes the use of intrusive questions that can negatively affect survey participation while attempting to give all adult residents in the household an equal chance of being selected. This procedure begins by asking the household spokesperson how many adults reside within the household and takes advantage of the fact that approximately three-quarters of all County households have only one or two adults in residence. In households where only one adult resides, no respondent selection procedure is required, and interviews were attempted with that adult. In households where two adults were

found to reside, CATI randomly selected either the initial adult contacted or the household's other adult. In households where three or more adults resided, CATI first determined whether the adult being screened should be the randomly selected respondent after giving each adult an equal chance of being selected. If that adult was not selected, then the "most recent birthday" method was used to identify which of the other household adults should be the selected respondent. Once an adult was selected, repeated attempts were made to reach and complete an interview with that individual.

Adult Survey Main Questionnaire

Once the designated adult had been selected, that individual was asked to participate in the survey. The Adult Survey instrument consisted of a core set of more than 200 questions, although not all questions were applicable to all respondents. The average length of administration time for this core set of questions was 28 minutes, and ranged from an average of 26 minutes in English to 32 minutes in the non-English languages.

The topic areas included in the Adult Survey's core set of questions were as follows:

1. *Health status:* An initial series of questions to determine the respondents' overall health and general physical and mental well-being.
2. *Nutrition, body mass and diet:* Several questions asked about the respondents' weight and height, their fruit and vegetable intake, and their frequency of eating at fast food restaurants.
3. *Health conditions:* This section asked whether various health conditions applied to the respondents, including heart conditions, diabetes, high blood pressure, high cholesterol, and depressive disorders.
4. *Mental health and treatments/counseling for addictions:* Questions then determined whether respondents reported having symptoms of mental or emotional disorders, as well as whether they had received any treatment or counseling for substance abuse or addictions.
5. *Disabilities and caregiving to persons with a disability:* An initial set of questions was included to determine whether respondents had a long-term impairment or disability

lasting three months or longer. Another set of questions asked whether respondents provided care to anyone who had a disability or long-term illness, and if so, asked about the extent of care provided, the nature of the illness and characteristics of the person being cared for.

6. Employment, daily activities and exercise: These items asked about the respondents' employment status and also the extent to which they engaged in vigorous or moderate exercises or activities during a usual week.
7. Emergency preparedness: Questions in this section asked respondents whether they had sufficient food and water supplies to sustain their household in the event of a disaster such as an earthquake, fire or terrorist attack, and whether they were aware of 211, the county's health information help line.
8. Health insurance: This section ascertained whether respondents currently had health insurance or were covered under any kind of health care plan, and if so, what type of coverage this was.
9. Barriers to accessing health care: Questions in this section sought to identify barriers to receiving medical care when it was needed, including affordability and transportation. Other items queried respondents about their usual source of care and when they last visited a doctor or dentist.
10. Preventive health care: These questions asked about the respondents' use of preventive services, such as having their blood pressure or cholesterol checked, undergoing a pap smear or mammogram (among women), and receiving flu shots (among adults age 50 or older), or pneumonia shots (among adults age 65 or older). Other questions probed respondent awareness of human papilloma virus (HPV), and among women aware of HPV, asked whether they had received or were likely to receive HPV vaccination in the future.
11. Tobacco use and exposure: This section explored the extent of past and present tobacco use by respondents, including efforts to quit smoking (among smokers) and exposure to another's smoking (among non-smokers).

12. Alcohol consumption: Those who reported having consumed alcohol in the past month were asked about their extent of alcohol use and frequency of binge drinking in the past month.
13. Methamphetamines: Questions asked respondents whether they had ever used methamphetamines and obtained respondent perceptions of the seriousness of methamphetamine use in their community.
14. Sexual behavior, AIDS/HIV risk and contraception: Respondents were asked questions about their sexual behavior, and among those sexually active, about their use of condoms and other birth control, including the morning-after pill. Respondents were also asked whether they had been tested for HIV in the past two years and the circumstances surrounding this test.
15. Demographic Questions: This section obtained basic demographic questions about the respondent and his/her household, including age, sex, race/ethnicity, education, income, place of birth, sexual orientation, education level, marital status, household size and composition, language spoken most in the household, internet access, city of residence, zip code and household address or the two closest cross streets to their home.

Additional Questions Asked of Subsamples of Adults

In addition, the Adult Survey sample was subdivided into seven random subsamples, and respondents within each subsample were asked an additional series of questions averaging 2-3 minutes. This provided the County with survey information on a wide range of topics from random samples of approximately 1,000 adults each.

The topics covered in these random subsamples included the following:

1. Health program effectiveness, health information sources and the built environment: This section measured perceptions of the effectiveness of different types of public health programs and services and respondents' primary health-related information sources. Additional questions probed accessibility to public transit, the number of vehicles owned, and their usual form of transportation for short errands within one mile of their home.

2. Nutrition: These items measured respondent perceptions of how healthy their diet was, their healthiest weight, the number of sodas or sweetened drinks they consume, their perceptions of the number of calories in common foods and drinks, perceptions about the dangers of trans fats and their opinion of various public policy proposals relating to diet and nutrition.
3. Pets, sleep and HIV/STD testing: This series included questions about the prevalence of pet ownership and types of pets, hours of sleep usually obtained and the number of hours of sleep respondents thought they needed. Other question probed opinions about HIV and STD testing, reports of having been tested for STDs or being told by a health professional that they should be tested for STDs. This section also included a question on whether respondents had served time in a correctional facility.
4. Methamphetamines and alcopops: This section asked about respondent knowledge of persons who have used methamphetamines and their general awareness and perceptions of the drug. Also included were measures of the usage of alcopops, awareness of alcopop advertising, and reactions to public policy proposals having to do with alcopops.
5. Tobacco policy: This series asked about the perceived dangers of tobacco use, exposure to second-hand smoke and smoking among minors. Other questions examined respondents' support for restrictions on tobacco sales, cessation programs and smoking bans in various venues. This section also queried respondents about their type of housing and home ownership.
6. Pandemic flu: Questions in this series measured how respondents would respond to the outbreak of pandemic flu, their ability to shelter in place for extended periods, and ability to care for household members who got sick during a pandemic flu outbreak.
7. Child health policy: This section asked respondents to assess the quality of their community as a place to raise children, their opinions about factors affecting child development and their awareness of First Five L.A.

The Adult Survey's English-language screener and core questionnaire, as well as its seven additional subsample sections, are included in the Appendix section of this report.

Structure and Content of the Child Survey Questionnaire

Survey Screener

As part of Phase One of data collection for the Child Survey, participants in the Adult Survey in which one or more children under age 18 resided were asked a series of questions at the conclusion of that interview to identify the mother or other parent/caregiver of one or more children ages 0-17 living in the household. If the original adult interviewed was the parent/caregiver, attempts were made to either continue the interview or to schedule a callback at a later time. If the parent/caregiver was not the person participating in the Adult Survey, attempts were made to either transfer the call to the appropriate parent/caregiver at that time or arrange a convenient time to call back to reach that person.

During Phase Two of the Child Survey, a random sample of County households was screened for the presence of children, and interviews were completed with the parent/caregiver of one randomly selected child in that household. The following information was sought from the household spokesperson as part of the screener for this portion of the Child Survey:

1. Confirm that the household was located within Los Angeles County.
2. Ascertain whether a child under age 18 lived in the household.
3. Ask to speak to a parent/caregiver (typically the mother) of the child or children living in the household.
4. Determine the preferred language of the parent/caregiver.

Once the parent/caregiver was identified and reached, the interviewer introduced himself or herself (if necessary) describing the overall purposes of the call and the survey's sponsor. Other pertinent information about the survey was provided as necessary, including the fact that the household's telephone number had been randomly generated by computer, the survey was confidential, and that all answers given would not be identified with them or their child in any way. Upon request, parents/caregivers were also provided with the telephone number at Field, and/or the County Health Department to verify the authenticity of the survey or seek additional information.

Respondent and child selection procedures

The 2007 LACHS followed the same procedures used in previous Child Surveys with regard to the identification and recruitment of the parent/caregiver of children under age 18 within each

household. In Phase One, at the conclusion of the Adult Survey respondents were asked a series of questions to identify the mother of one or more of the children residing in the household. If the child's mother did not reside in that household, the interviewer then asked to speak to the child's other parent, or the child's primary caregiver. In households where multiple families resided, a random selection procedure ("most recent birthday" method) was employed for selecting which parent/caregiver to interview. Similar respondent selection procedures were followed for identifying parents/caregivers in Phase Two of the Child Survey sampling, after a child household had been identified.

One other selection procedure that was integral to the Child Survey was the random selection of the designated child about whom the parent/caregiver would be discussing. Similar to the procedures followed in prior LACHS Child Surveys, the 2007 LACHS utilized the "most recent birthday" method for randomly selecting one child to discuss in households where multiple children resided.

Child Survey Questionnaire

The parent/caregiver was then administered the Child Survey questionnaire. The Child Survey also included over 200 questions, although many of them were specific to children of certain age groupings. Somewhat longer interviews were conducted when the child being referenced was age 0–5, while shorter interviews were conducted among parents with children age 6–17. In addition, because some of the demographic characteristics of respondents and households included in the Child Survey were captured as part of the Adult Survey Phase One, follow-up interviews were generally shorter than those completed as part of Phase Two. Because of this, the average interview length of the Child Survey ranged from 17-25 minutes depending on the age of the child, with an overall average of 21 minutes. This overall average also varied by language of the interview, with English language interviews averaging 18 minutes and those conducted in non-English languages averaging 23 minutes.

The 2007 Child Survey questionnaire was structured to include the following sections and topics:

1. *Child selection and background questions:* The section obtained information about the number of children in the household and then randomly selected one child under age 18 as the designated child for the survey. Basic background information about the child was

obtained, including the child's gender, age and whether each female respondent was that child's biological mother.

2. *Infant questions:* This section of questions was administered to parents/caregivers whose randomly selected child was a child age 0-5. It included items about preconception knowledge, breastfeeding practices (among biological mothers), reasons for discontinuing breast feeding and employment of the mother during the child's early years.
3. *Daily activities and family interactions:* Parents/caregivers were asked questions having to do with day-to-day activities that occur within the household, such as the number of days a family member reads, tells stories or plays music or sing with the child.
4. *Nutrition:* This section included questions about the number of days in a typical week that the child eats breakfast, how frequently the child eat food from fast food restaurants and the number of sodas or sweetened drinks the child consumes in a typical day.
5. *Physical activity:* Parents/caregivers were asked the number of hours in an average day the child spends watching TV, using a computer or playing video games at home. Another series of questions probed how often the child did various physical activities, such as walking, biking, or skateboarding to school, playing a team sport, participating in bicycling, rollerblading or skateboarding, playing physically interactive games or going to classes to do gymnastics, dance, karate, or similar activities. Parents/caregivers were also asked to assess their community as place to be physically active, as well as their access to parks, playgrounds or other places where the child could play.
6. *Health conditions:* After obtaining an assessment of the child's overall health, various questions were asked regarding whether a doctor or health professional had ever told the parent/caregiver if their child had attention deficit disorder, autism, diabetes or asthma. In cases where one or more of the health conditions were reported, follow-up questions were posed about the child's condition. Additional questions determined whether the child might have undiagnosed asthma.
7. *Childcare:* Parents/caregivers who were discussing a child under age six were asked a series of questions about the childcare arrangements used and any difficulties they had in

finding or paying for such care. Measures were also obtained as to their awareness and specific knowledge of the organization, First 5 L.A.

8. Pandemic flu: Questions were posed asking parents/caregivers about the difficulties they had in arranging care for their child for various lengths of time should there be an outbreak of pandemic flu and the child's school or child care facility was closed.
9. Health insurance: Parents/caregivers were asked whether their child was currently covered by health insurance or any other kind of health care plan, and if so, what type of coverage they had. For those children without health insurance, questions were asked about the parent's/caregiver's awareness of government insurance programs, such as Medi-Cal, Healthy Families and Healthy Kids, and whether the parent/caregiver thought their child was eligible for any of these programs.
10. Use of health services and preventive care, barriers to accessing health care: Questions in this section asked parents about their usual source of health care for the child and the child's last visit to a dentist. A number of questions sought to identify barriers to the child receiving medical care, including cost, transportation, and language difficulties. Awareness of Human Papilloma Virus (HPV) was also determined. If the designated child was a female age 9 or older, the parent was asked whether the child had received HPV vaccination or was likely to receive such shots in the future, and if not, what the reasons were for not vaccinating.
11. Parental support and mental health: Various questions in this section asked parents about their access to people who could provide them with advice when they had encountered problems in raising their child. Other questions asked parents about their own social support systems, mental health and use of mental health services.
12. Smoking and second-hand smoke: Questions in this section probed whether the mother/primary caregiver smoked, the exposure of their child to smokers in the home and the rules of the house regarding where and when smoking is allowed.
13. Child demographics: This section contained various demographic questions about the child not asked previously in the survey, including race/ethnicity and place of birth.

14. *Parent demographics:* This section included questions pertaining to the demographic characteristics of the parent/caregiver and the household itself, including education, income, marital status, employment status of the respondent and her spouse, language used most in the home, place of birth, household size and composition, city of residence, zip code and street address or closest intersections to their home.

The English-language versions of the Child Survey questionnaire is included in the Appendix section of this report.

Survey Languages

Because of the heavily multi-ethnic makeup of Los Angeles County and the relatively high proportion of residents who speak little or no English, the 2007 LACHS was administered in English, Spanish, Chinese (Cantonese and Mandarin), Korean, and Vietnamese. Over one-quarter (26%) of all adults interviewed as part of the 2007 LACHS were completed in non-English languages, while over four in ten (43%) of all parents/caregivers were interviewed in a non-English language as part of the Child Survey.

Translation and Translation Review

The processes employed by Field in the development of the translations for the 2007 LACHS involved the participation of a number of parties and Field staff oversight. The first step in this process involved compiling all the translations from the 2005 LACHS surveys of identical questions that were being reported as part of the 2007 LACHS. These translations were copied forward and incorporated into the 2007 questionnaires to assure direct comparability with prior measures.

Initial translations for all new or revised survey questions were prepared for Field by a Palo Alto-based professional translation service. These translations were then reviewed by an independent third party. In the case of the Spanish and Mandarin questionnaires, County staff persons fluent in each language served this role. For the remaining languages an Oakland-based professional

translation service specializing in Asian language translations was employed. The translation process leading to the development of the pre-approach letter followed a similar path.

In addition, at the County's direction, at the conclusion of this process, all Asian language translations were forwarded to another Los Angeles-based translation service for final review and where appropriate, additional edits were incorporated into the translations.

Questionnaire Programming

The English and Spanish language versions of the survey questionnaire were then programmed onto Field's computer-assisted telephone interviewing (CATI), while the Mandarin, Cantonese, Korean and Vietnamese language versions were programmed onto Field's web-based counterpart, MR Interviewer.

Both the CATI and MR Interviewer systems control the telephone scripts read to individual respondents by displaying each appropriate questionnaire item one at a time on computer screens at each interviewer's booth. The interviewer then reads each question aloud to the respondent from the screen and enters the pre-coded answer category through the keyboard directly to computer disk. All answers are automatically stored in computer memory. This allows for greater consistency in interviewing by controlling all skip patterns, branches, randomization of items in a battery, "refer backs," and other control features during the call. It also affords greater opportunities for internal control since the development and programming of the questionnaires remain under the direct control and supervision of the project coordinator.

These systems also enable the questionnaires to be personalized, as needed. For example, for the Child Survey questionnaire, the system has the capability of inserting the name of the randomly selected child into each survey question applicable to that child. (e.g., What is <NAME's> age?) This frees the interviewer to concentrate on his or her interviewing technique and insures a clear and unambiguous questioning process. In addition to sequencing and personalizing questions, the CATI and MR Interviewer systems perform various quality control functions, including on-line editing. One such function rejects ineligible codes entered by an interviewer to all pre-coded questions. For example, if there are only two eligible codes to a question (e.g., Yes = 1 and No = 2), if an interviewer attempts to enter a "0" or other inappropriate number, it is rejected. For

items that seek a numeric reply, each system rejects data falling outside acceptable ranges. For example, when asking about a child's age, any number greater than 17 was rejected. In such instances, the interviewer would then recheck the child's exact age with the respondent before proceeding to the next question or terminate the interview if the child was not under age 18. The capability to incorporate sequencing and logic checks was crucial to the interview, tailoring each survey and survey question to each respondent's unique situation through this questionnaire sequencing process.

Once the programming was completed, the script from each questionnaire in each language was reviewed on-line by Field staff persons to check all questions, response alternatives, and skip patterns.

Pre-testing and Pilot Test

Once penultimate versions of the Adult Survey and Child Survey questionnaires had been prepared and had been programmed, Field conducted an initial pre-test of the survey questionnaires in English and Spanish by calling small samples of households in Los Angeles County. Several pre-tests were staged. Each was designed to assess general ease of administration, refine item wording, and provide an initial assessment of its average length of administration of each questionnaire. These calls were monitored by the Project Coordinator, Field staff supervisors and, whenever possible, were remotely monitored by representatives of the County. Changes were made to the questionnaire, as appropriate, following each pre-test.

A more formal pilot test was then conducted among approximately 100 County households using the Adult Survey and Child Survey questionnaires that emerged from pre-testing. The pilot test was designed to employ the same survey procedures and to test all survey protocols to be used in full-scale data collection. It also provided an opportunity to test each of the seven subsample question series developed for the Adult Survey. County representatives again participated in the pilot testing process by monitoring interviews remotely, along with the Project Coordinator and Field staff supervisors. Upon completion of the pilot test, Field conducted a de-briefing with the pilot test interviewers and supervisors who, along with County representatives, provided final

feedback relating to the survey instruments. Changes resulting from the pilot tests and debriefings were then incorporated into each survey questionnaire as appropriate.

Telephone Interviewing Facilities

Data collection for the 2007 LACHS was completed from Field's central location interviewing centers in San Francisco and San Diego as well as from Field's headquarters office in San Francisco.

In each calling facility, trained interviewers did the calling from individual sound-protected telephone stations under the full-time supervision of staff monitors. All stations in each call center were equipped with CATI for administering the survey's English and Spanish language interviews. All Asian language interviewing was administered using Field's web-based MR Interviewer system from Field's San Francisco headquarters. Each of these installations offers remote as well as on-site monitoring capabilities, where staff supervisors, the project team and clients can listen in to monitor and evaluate the interviewing in progress.

Interviewer Recruitment and Training

Field's employed a total of 162 interviewers to complete the 2007 LACHS calling effort. At the beginning of the data collection period, Field's staff of English language and bilingual English and Spanish language interviewers were trained to conduct the initial data collection. As the interviewing proceeded, additional training sessions were held to expand the number of English language and bilingual English and Spanish language interviewing staff, and to incorporate bilingual and trilingual Asian-language staff. Over the course of interviewing, households requiring Spanish or Asian language callbacks were identified and grouped together for callback attempts by in-language interviewers. Spanish language callbacks were conducted on an ongoing basis throughout the data collection period. The Asian language callbacks were accumulated and called back toward the end of the data collection period to make the interviewing time spent by the Asian language staff as efficient as possible.

Field is fully cognizant of the role that the interviewer plays in obtaining accurate and reliable survey data and recognizes the critical importance of not allowing the interview experience itself to potentially bias the results. As such, all of the interviewing conducted by Field meets the best practice standards for survey research established by the industry's leading professional associations. In addition, all full-time staff working on the project have undergone HIPAA training to ensure that proper confidentiality procedures are followed.

Some of the training procedures employed by Field to assure high quality and uniform telephone interviewing practices among its interviewing staff throughout the conduct of the 2007 LACHS are described below:

An interviewer training course provided interviewers with both general and specific interviewing instructions, refresher reviews and on-line monitoring of telephone interviewing. This includes an introduction to survey research, a description of interviewer roles and responsibilities, general interviewing techniques and record keeping, refusal conversion techniques, and confidentiality procedures. In addition, procedures were reviewed for the proper management of non-English speaking households.

At the conclusion of their training, interviewers conducted mock interviews, and Field's professional interviewing supervisors evaluated their performance.

Before the start of data collection, all interviewers working on the study were required to attend a briefing session where specific calling procedures were described in detail by the Project Coordinator or by survey staff supervisors. These sessions provided interviewers with an overview of the LACHS and included a question-by-question review of all items in each survey. The sessions discussed recommended best-practice approaches for dealing with different interviewing situations, specifics on how to document the results of each contact attempt, the scheduling of callbacks, and confidentiality requirements.

Debriefings and retraining sessions were held as necessary to ensure that all interviewers were following consistent procedures. The performance of each member of the interviewing team was closely monitored and evaluated, especially during the first few days of interviewing. In addition, from time to time interviewers were asked to meet together as a group to discuss their interviewing experiences on the project.

Throughout the interviewing period “data correction sheets” were available to all interviewers to note inadvertent errors or respondent changes to answers after the initial recording of a response was entered during the interview.

Pre-Approach Letter

For the Adult Survey an advance letter was sent to each of the RDD sample listings where a matching household address could be found. The advance mailing included a one-page letter printed on Los Angeles County Public Health Department letterhead and signed by the Director. Because the language spoken in each household was not known in advance, the letter was translated into Spanish, Chinese, Korean and Vietnamese languages and printed along with the English version as a four-page booklet. The booklet, as well as its outer envelope, was printed on Los Angeles County Public Health Department stationery.

The letter briefly explained the purposes of the survey and informed each household that it had been selected to participate in an important survey on health that the department was conducting. The letter informed each household that they should expect to receive a call from a telephone interviewer in the next couple weeks. The letter also referenced the telephone number of the Los Angeles County Department of Public Health’s Office of Health Assessment and Epidemiology as well as a website for households wanting more information or having any specific questions. A copy of the advanced letter can be found in the Appendix section of this report.

Mailings of the booklet letter were staggered throughout the data collection period with the goal of timing the mail-out letters so that households would receive them in advance of the first telephone call attempt to the household. In total, approximately 30,000 booklet letters were mailed prior to telephone attempts to the Adult Survey.

After the letter distribution had taken place, it came to the County’s attention that some transcription errors had been made by the printer in the reproduction of the Vietnamese language version of the letter. In reaction to this, a full-page ad was placed in the County’s largest Vietnamese language newspaper, the *Saigon Times*, on two separate occasions to inform the Vietnamese community of the printing mistake and displaying a corrected version of the letter in the ad. The ad sought to encourage those who received the letter to participate in the survey, was

run under the caption, “Your Opinion Counts,” and was printed under County Public Health Department letterhead and signed by the Director.

One of the main reasons for incorporating a pre-approach letter into the 2007 LACHS was to attempt to stimulate survey cooperation. This appears to have been the case, since the cooperation rate of households mailed the pre-approach letter was nine percentage points higher (47%) than those who were not mailed the letter or whose letter was returned as undeliverable (38%). However, it is also possible that the demographic differences between the population of households for which address listings could be found and those for which address listings were not available may also have contributed to the differential in cooperation rates.

Study Auspices and Confidentiality

At the beginning of each call in which a household was reached, the household spokesperson answering the phone was told that the study was being conducted on behalf of the Los Angeles County Department of Public Health. Those who wanted to verify the survey’s auspices were provided with a contact telephone number within the Public Health Department where they could obtain additional information. To maintain confidentiality and maximize cooperation, residents were also assured that their answers to all questions were voluntary and confidential and that no personal information given during the survey would be individually identified with them. During the data collection and data processing phases, access to all respondent information was carefully controlled and restricted internally at Field through a system of passwords. Upon completion of the data processing phase, all respondent-specific and household-specific information, such as address, telephone number, and respondent names (when provided) were purged from the data files before they were delivered to the County.

Availability of Field’s Toll-Free Telephone Number

Field maintained a toll-free number throughout the data collection period for respondents who had questions about the survey. In addition, when interviewers encountered an answering machine during their final call attempt to a household, a message was left referencing the

availability of the toll-free number which respondents could call to participate in the survey. For control purposes, telephone numbers eligible for such 800 number callbacks were stored in memory to confirm that the party phoning back was indeed among those phone listings eligible for inclusion into their respective samples.

Sample Management

An important task throughout the telephone interviewing phase was the collection of information relating to the outcome of call attempts made to each sample listing dialed during the survey. Field employed its proprietary Sample Management System (SMS) for this purpose. As interviewers recorded the result code of each interview attempt, Field's SMS system was programmed to group together similar categories of call outcomes and determine the proper next step that should be taken for each listing. The system also produced regular summary reports of call attempt outcomes throughout the interviewing period. These summaries allowed the Project Coordinator and survey supervisors to continuously monitor the progress of interviewing, identify potential problem areas in data collection and provide ongoing feedback to the interviewing staff. After the completion of data collection, the SMS system provides metrics reporting the disposition of final call attempts to each listing dialed.

Number of Call Attempts

For the Adult Survey, up to eight attempts were made to reach, screen and interview an eligible adult at each residential sample listing dialed. Similarly, for Phase Two of the Child Survey, up to eight attempts were made to reach, screen and attempt to interview an eligible parent/caregiver in each child household. Even greater efforts were made when attempting to implement Phase One of the Child Survey in which follow-up interviews were made with the parents/caregivers in child households that had already participated in the Adult Survey. For these households up to twenty-four call attempts were made to reach and complete an interview with the appropriate parent/caregiver.

Initial telephone contact attempts were made during the early evening hours on weekdays and throughout the day on weekends to maximize the chances of including both working and non-working adults. Callbacks were made at different times and on different days to increase the probability of finding qualified adults available for the interview. Where possible, appointments were made at a specified date and time to maximize cooperation rates. Callback appointments were scheduled throughout the interviewing period seven days a week as requested by the respondent.

Refusals and Refusal Conversion Procedures

An increasing problem when conducting public opinion research surveys in the United States relates to the public's growing reluctance to participate. Most refusals in telephone surveys occur at the very onset of the interview attempt. Although some are not preventable, when interviewers encountered a refusal, they were trained to employ one of several possible protocols, depending on the respondent's initial response or apparent reason for not participating. This involves interviewers reading slightly different scripts to refusers who appear initially uninterested, hesitant or simply lack confidence.

Interviewers were also instructed to categorize each refusal into one of two broad categories – “hard refusals” for households in which the spokesperson was adamant about not being called back again, and “soft refusals” for other households, based on the reaction they received to each call attempt. No further action or interview attempts were made to households categorized as a “hard refusal.” Refusals categorized as soft were re-opened and called back after a fixed period of time had passed (typically at least one month). Under this approach, the initial follow-up call attempt was made as if the initial refusal had never occurred. These calls were made at different times of day and on different days of the week than when the initial refusal occurred.

For households that continued to refuse, or for those where a respondent began the survey but broke off (but excluding “hard terminates”), a specially trained team of refusal conversion interviewers re-approached the household, using a “call with concern” procedure. These interviewers have received special training in methods to re-contact and encourage the participation of those who had originally declined, and consulted all previous details from the approaches to the households that might be useful in helping to obtain cooperation.

Interviewing Dates

All data collection for the 2007 LACHS was completed April 3, 2007 through January 22, 2008. Interviewing for the Adult Survey and Child Survey (Phase One) began simultaneously at the start of the data collection period on April 3, 2007. Interviewing on the Adult Survey was completed on December 29, 2007, while interviewing on the Child Survey (Phase Two) was completed on January 22, 2008.

Disposition of Interview Attempts – Adult Survey

The following is a summary of the disposition of the final call attempts made to the 2007 LACHS Adult Survey:

Total listings dialed	<u>83,665</u>
Completed Adult Survey interview	<u>7,205</u> *
Completed screening questions/ineligible for survey	<u>630</u> **
Refusals/break-offs	<u>11,057</u>
Initial household refusal prior to screening	7,634
Refused after household screening	2,796
Terminated by respondent/partial	627
Not a residential (landline) phone	<u>36,174</u>
Not working/disconnected/changed number	20,969
Fax/modem/pager	5,616
Cell phone	158
Business/institutional/other non-residence	9,431
Non-contacts	<u>20,295</u>
Answering machine/other non-contact on final attempt	18,162
Respondent unavailable/callback	1,068
Language, communications barrier	990
Blocked number	75
Unknown household eligibility	<u>8,239</u> ***
Repeated no answer/busy signal	8,239
Other	<u>65</u>
Cooperation Rate	40%
Response Rate	18%

* 5 cases were pulled in tabulation, resulting in an effective sample size of 7,200.

** includes non-adult households and those living outside the Los Angeles County (for the main sample) and outside the Antelope Valley (for the augmented sample).

*** for response rate calculations, 20% of these are estimated to be households

Cooperation and response rates were calculated using the American Association for Public Opinion Research's (AAPOR's) "Outcome Rate Calculator" found at its web site at www.aapor.org.

The cooperation rate reported is AAPOR's Cooperation Rate 3 (COOP3), derived from the following formula:

$$\text{COOP3} = I / ((I+P) + R), \text{ where}$$

I = completed interviews

P= partial interviews

R= refusals or break-offs

The response rate reported was calculated using AAPOR's Response Rate 3, derived from the following formula:

$$\text{RR3} = I / (I+P) + (R+NC+O) + e(UH+UO), \text{ where}$$

I = completed interviews

P= partial interviews

R= refusals or break-offs

NC= non-contacts

O= other

e= estimate of the proportion of eligible households among all numbers for which a definitive determinations of status was obtained

UH= unknown household

UO = unknown other

Disposition of Call Attempts – Child Survey

The following is a summary of the final disposition of call attempts made to the 2007 LACHS Child Survey:

	<u>Total</u>	<u>Phase 1</u>	<u>Phase 2</u>
Completed Child Survey interview	5,728	1,363	4,365
Completed screening questions/ineligible for survey	26,692*	--	26,692
Refusals/break-offs	<u>8,775</u>	<u>646</u>	<u>8,129</u>
Initial household refusal prior to screening	6,825	--	6,825
Refusal after household screening	1,554	582	972
Terminated by parent/partial	396	64	332
Not a residential (landline) phone	<u>34,240</u>	<u>151</u>	<u>34,089</u>
Not working/disconnected/changed number	21,588	136	21,452
Fax/modem/pager	4,688	4	4,684
Cell phone	123	2	121
Business/institutional/other non-residence	7,841	9	7,832
Non-contacts	<u>23,297</u>	<u>428</u>	<u>22,869</u>
Answering machine/other non-contact on final attempt	20,364	294	20,070
Respondent unavailable/callback	1,839	132	1,707
Language, communications barrier	1,057	2	1,055
Blocked numbers	37	0	37
Unknown household eligibility	<u>6,928**</u>	--	<u>6,928</u>
Repeated no answer/busy signal	6,928		6,928
<u>Other</u>	<u>192</u>	<u>76</u>	<u>116</u>
Cooperation Rate	40%		
Response Rate	15%		

* includes non-adult households and those living outside the Los Angeles County (for the main sample) or outside the Antelope Valley or West LA SPAs (for the augmented sample).

** for response rate calculations, 20% of these are estimated to be households.

The cooperation and response rates reported for the Child Survey reported were calculated in a similar manner and using the same formulae as those for the adult survey.

Discussion of Response Rates

Before discussing the response rates achieved this year, we first wanted to highlight some of the techniques used by Field to maximize survey participation in the 2007 LACHS.

1. One significant enhancement made to the 2007 LACHS was the incorporation of an advance mailing to all sampled cases in the Adult Survey with mailable addresses identified by our sampling vendor, Survey Sampling Inc. This involved the mailing of approximately 30,000 booklet letters printed in English, Spanish, Chinese, Korean and Vietnamese over a five-month period spanning April through August 2007. To emphasize the survey's legitimacy and importance, the booklet letter was printed on Los Angeles County Public Health Department stationery and signed by the Director. To maximize its impact, mailings were staggered throughout the data collection period with the goal of reaching households shortly in advance of the first call attempt to the household.
2. Consistent with data collection procedures of previous LACHS studies, extra efforts were made to provide additional training to Field's staff of interviewers and interview supervisors at the onset of data collection to encourage the use of methods that would stimulate respondent participation and reduce refusals. Also, interviewers assigned to calling back households that had initially refused were given special training in techniques for re-contacting such households.
3. While most interviews were completed within the first few call attempts to households, up to eight attempts were made to reach, screen and interview an eligible respondent within each potential household listing. In addition, for Phase One of the Child Survey even greater efforts were made – up to 24 attempts – to reach and complete a follow-up interview with the parent/caregiver of a child living in each Adult Survey household in which a child age 0-17 resided.
4. An enhanced method was used to select which household adult to interview for the Adult Survey, which enabled us to bypass the enumeration of all adult household members and, at the same time, reduce the use of the sometimes unreliable "most recent birthday" method of respondent selection that had been used in earlier LACHS studies. Because this

respondent selection procedure was less intrusive, but produced a valid probability of selection of adults, in our opinion, its usage had a positive effect on response rates.

5. An increasingly important procedure for representing the growing racial and ethnic diversity of the Los Angeles County adult and child populations was making callbacks to households where a Spanish or Asian language communications barrier was detected or where a specific non-English language was requested by the selected respondent. These callbacks resulted in an increased proportion of non-English interviews for both the Adult Survey and Child Survey in 2007, permitting households not fluent in English and those who had a difficult time understanding or speaking English to participate in their own language.

Nevertheless, the response rates achieved in the 2007 LACHS were not as high as we would have liked and were lower than those achieved in earlier LACHS studies conducted by Field for the County. Declining response rates, however, are not just a problem for the LACHS, but are common to all telephone surveys conducted by the leading survey research organizations in the U.S. in recent years. We generally caution against the simple comparison of the response rates of one survey to another since such comparisons are complicated by the fact that the surveys may differ methodologically in terms of their sampling, types of respondents targeted for interview, interview approach, survey length, among other factors. Yet, as a way to demonstrate the declines other prominent researchers are facing when conducting large-scale health surveys in Los Angeles County, it is useful to examine the response rates of recent California Health Interview Surveys (CHIS). These surveys are in many methodological ways similar to the LACHS, since its Adult Survey involves sampling one adult per household by telephone using an RDD sampling approach and attempting an interview of about 30 minutes on similar topics including health status, health conditions and health risk behaviors. According to CHIS's published methodological reports, the response rates it has been encountering have been declining at a fairly consistent and steady clip over the years. In particular, the response rates of CHIS interviews completed in Los Angeles County have proved to be particularly problematic, and exhibit consistently lower rates of response than those encountered in other California counties. Specifically, CHIS's reported response rates applicable to its adult sample interviews in Los Angeles County declined from 34.1% in 2001 to 28.1% in 2003 to 23.6% in 2005.

Given this observed long-term trend and our recent experience in conducting the 2007 LACHS, it is likely that the response rates for its adult sample interviews in Los Angeles County from the 2007 CHIS (for which published response rates to our knowledge are not yet publicly available) will be near the 20% level.

In addition, it is important to note one important methodological difference between CHIS and the LACHS. This relates to CHIS's use of monetary incentives to respondents for participation in its surveys, which have not been employed in any of the LACHS studies. This, in our opinion, is one reason why the response rates from CHIS's Los Angeles County samples have been generally higher than those of the LACHS at comparable points in time. But, while incentives have been proven to improve response rates to some extent, as the CHIS experience demonstrates, they are not a panacea for reversing the overall long-term decline in response rates.

Declining response rates have unfortunately become the norm rather than the exception when conducting relatively long 30-minute telephone surveys among a random sample of adults using an RDD sampling methodology, especially among a highly urban, heavily immigrant population like that of Los Angeles County. But, the more important issue to consider is whether lower response rates necessarily translate to diminished quality data. A number of recent studies have shown that the accuracy of survey data from RDD studies with lower response rates do not differ in significant ways from those with high response rates. This is because survey nonresponse frequently is caused by factors not correlated with the subject of the survey.

An interesting summary discussion of this can be found at the American Association for Public Opinion Research's web site <www.aapor.org>. The piece, entitled "Response Rates – An Overview," states the following with regard to the relationship between response rates and survey quality:

“. . . two factors have now undermined the role of the response rate as the primary arbiter of survey quality. Largely due to increasing refusals, response rates across all modes of survey administration have declined, in some cases precipitously. As a result, organizations have had to put additional effort into administration, thus making all types of surveys more costly. At the same time, studies that have compared survey estimates to benchmark data from the U.S. Census or very large governmental sample surveys have also questioned the positive association between response rates and quality.

. . . consumers of survey results should treat all response rates with skepticism, since these rates do not necessarily differentiate reliably between accurate and inaccurate data. Instead consumers should pay attention to other indicators of quality that are included in reports and on websites, such as insignificant levels of bias, low levels of missing data, and conformity with other research findings."

Two recent academic studies, in fact, have found little relationship between response rates and accuracy of surveys conducted by some of the nation's leading research organizations. These include Allyson L. Holbrook, et. al. "The Causes and Consequences of Response Rates in Surveys by the News Media and Government Contractor Survey Research Firms," presented at the Second International Conference on Telephone Survey Methodology, January 2005; and Scott Keeter, et. al. "Gauging the Impact of Growing Nonresponse on Estimates from a National RDD Telephone Survey," *Public Opinion Quarterly*, 70(5), Special Issue 2006, pp.759-779.

Thus, while we agree that lower response rates are not helpful, we believe that the survey procedures employed by Field when implementing the 2007 LACHS should serve to assure the County that the information derived from both the Adult Survey and the Child Survey are accurate and reliable.

Data Processing

After the completion of data collection, all survey information was processed from Field's data processing center located within its San Francisco headquarters. This allowed for direct supervision and control over all processing functions by the Project Coordinator and Field's MIS and programming staff.

A number of post-survey data checks and review tasks were performed by Field's data processing and coding staff. As a first step, all data from both the Adult Survey and Child Survey were systematically formatted in preparation for data cleaning and processing.

Survey questions that permitted short verbatim replies, when the established pre-coded response categories did not clearly fit respondent replies, were reviewed and coded into their appropriate answer categories by Field's coding staff. This includes questions in the adult and child survey where an "other" response was permitted, such as questions involving type of health insurance coverage, race, Hispanic or Asian ancestry, language spoken in the household, city of residence

and country of birth. At the conclusion of this review, verbatim replies that did not fit into any established code were given the "other" code designation in the data files, and all answers from these "other" lists were provided to the County at the conclusion of processing.

Because CATI and the MR Interviewer systems provide for the direct data entry of responses by the interviewer during the call and do not permit ineligible or invalid data entries, the data files resulting from data collection are virtually error free. However, because interviewers manually fill out error correction sheets when they have incorrectly entered a respondent's answer or when a respondent changes his or her response after it has been entered, the survey data require additional data "cleaning." All data correction sheets were reviewed and interview information corrected, as necessary, by Field's professional coding staff. Following this, an additional series of checks was performed by means of a specially designed cleaning program that scrutinizes each questionnaire for internally inconsistent information.

In addition, the coding staff also reviews the answers given to questions that provide overlapping information in an attempt to reduce item non-response. An example of this relates to the determination of a respondent's or child's racial and ethnic background. In cases when a respondent did not give a direct answer to the Hispanic origin, volunteered answers from that respondent relating to their race and country of birth were also examined. In some cases, answers to the Hispanic origin question originally coded as "refused" were changed to a "yes" response based on the information given to these other questions.

A similar procedure was followed with regard to respondent answers to the Armenian heritage question. Respondent answers to their country of birth were checked against answers given to this question, and answers to the Armenian heritage questions originally coded as "refused" were changed to a "yes" response base on this information.

Finally, answers given to a respondent's or child's specific country of birth were checked against the respondent's initial answer regarding whether they or their child was born outside the U.S. In some cases, respondent answers to this initial answer could have been changed based on the specific information given to the country of birth.

Throughout the entire data review and processing phase, special procedures were enforced to limit access to all project files through a system of internal passwords.

Geo-coding

Questions in both the Adult Survey and the Child Survey asked respondents to specify their city of residence, zip code and residential address. For respondents unwilling to volunteer their specific address, a follow-up question asked for the names of the two cross-streets nearest their residence. After the completion of interviewing, each piece of geographic information provided by the respondent was individually reviewed by Field's coding staff for completeness and internal consistency. The goal was to ensure that the geographic information recorded throughout each respondent record was as accurate and complete as possible. This review process involved several steps.

For example, if the city or, more typically, the respondent's specific residential zip code, was not provided, or if the zip code provided was inconsistent with their city of residence, other geographic information from the survey was examined in an attempt to resolve the inconsistency and provide a consistent coding of the record. When specific address or cross-street information was provided by the respondent, Field's coding staff consulted the 2007 edition of the Los Angeles County Street Guide (also referred to as The Thomas Guide), published by Rand McNally, to help resolve these inconsistencies. In cases where address or cross-street information was not provided, the area code and exchanges of the telephone number was examined.

At the conclusion of this review, the basic geographic information (city, zip code and street address or cross-streets) of each record, along with a respondent identification number, was turned over to County Public Health Department staff for final review. County staff then did their own independent review of each record to serve as a final check that the geographic information was internally consistent and accurate.

Following this review process, County staff then coded each record into its appropriate County Service Planning Area, Health District, and where possible, census tract. These data were then relayed back to Field and merged into the final data files through the respondent identification number. Once these codes had been entered into the data files, all respondent-specific and household-specific information, such as address, telephone number and respondent names (when

provided), were then removed from the data files to protect the confidentiality of all information provided on respondents during the survey.

Database Construction and File Preparation

At the conclusion of data processing, two unweighted data files, one applicable to the Adult Survey and the other applicable to the Child Survey, were prepared in standard ASCII format and delivered to the County, accompanied by all documentation necessary to read each file.

Statistical Weighting

For both the adult and child data files, appropriate statistical weights were then developed to account for differences in the probability of selection of households into each sample and to align the survey results to known geographic and demographic characteristics of the County's adult and child populations. This process involved first calculating a household weight and then a population weight for each individual record. In addition, at the conclusion of the statistical weighting process, both the Adult Survey and Child Survey data files were projected to the population of residential housing units and the population of non-institutionalized adults or children in Los Angeles County applicable to each file. A general description of the procedures used to develop these statistical weights follows.

Stage 1: Construction of the household weights

In the initial step, a base weight was calculated that takes into account household size for the Adult Survey and the number of children age 0-17 living in the household for the Child Survey. For the Adult Survey, the number of persons living in the household was enumerated during the survey. Using 2000 census-based data for Los Angeles County, weights were applied so that the total countywide adult sample reflected the estimated proportions of one-person, two-person, three-person, four-person and five-or-more-person families within the County. For the Child Survey a similar procedure was followed. This involved enumerating in the survey the number of children age 0-17 living in the household and then applying weights to align the child sample

to 2000 census-based estimates of the proportion of one-child, two-child, three-child and four or more child households in Los Angeles County.

A second step involved calculating a weight apportioning the samples according to the distribution of households across the county's eight Service Planning Areas (SPAs) and within each SPA the proportion of households where children age 0-17 resided. Control totals developed from the 2005 American Community Survey were used for this purpose. The household weights assigned to the Adult Survey and the Child Survey by SPA at this stage also served to align each survey's augmented samples (i.e., the Antelope Valley and West LA sample augments) to their proper proportions of the county's total adult and child household populations.

A two-dimensional raking procedure was then performed. The resulting weights were then used to develop additional weighting parameters relating to the proportion of one-telephone and multi-telephone households reached in each survey. During both the Adult Survey and Child Survey, respondents were asked how many different telephone lines for non-business use entered their household that were not dedicated data lines. Since households with two or more such lines would have a greater probability of selection in an RDD sample, these households were down-weighted.

The weighted data from the initial raking was also used to develop a statistical adjustment to account for the fact that the RDD samples systematically exclude households that either have no telephones whatsoever (non-telephone households) or rely only on cell phones to place residential calls (cell phone only households).

This was done by enumerating survey households into one of three categories: (a) households with continuous landline telephone service over the past three years; (b) households who reported an interruption in their landline telephone service of one month or longer, but had access to a cell phone to place residential calls (recent cell phone-only households); and, (c) households who had a landline service interruption of one month or longer but had access to no telephones whatsoever (recent non-telephone households).

A statistical adjustment was then made to account for the absence of non-telephone households and cell phone only households from each sample. In this approach, respondents who did not have continuous landline telephone service and who either had no cell phone service or had only

cell phone service during the time of their service interruption were weighted up to compensate for the absence of non-telephone households and cell phone only households from the survey's sample frame. In effect, respondents identified by the survey as being either recent non-telephone households or recent cell phone only households were used as surrogates for the population of households which were non-telephone households or cell phone only households at the time the LACHS was conducted. The non-telephone household adjustment follows work first developed by Keeter¹, while the adjustments for cell phone only households represents an extension of Keeter's method and is based on work first developed by Jay and DiCamillo². The control totals used in this process were derived from 2000 census-based estimates of the proportion of non-telephone households in Los Angeles County and from 2007 Center for Disease Control's National Health Interview Survey estimates of the proportion of households in that survey's Western region that were cell phone-only households.

The original two-dimensional raking procedure was then re-run adding these two new dimensions. The resulting set of individual household-level weights developed after this round of raking was identified as the "household weight" in both the Adult Survey and Child Survey data files.

Stage 2: Construction of the population weights

Stage 2 weighting then adjusted the Adult Survey and Child Survey to population-based estimates of the actual adult and child populations in Los Angeles County.

Using the household-weighted data, a third raking procedure was performed. The data source used for the control totals for this post-stratification and raking procedure were all derived from the 2006 Population Estimate and Projection System (PEPS) for Los Angeles County. For the Adult Survey, control totals were established for the distribution of adults by Health District (26 levels), gender (2 levels), age (5 levels) and SPA (8 levels), and for race/ethnicity (4 levels). For the Child Survey, control totals were created to represent the distribution of children age 0-17 by Health District (26 levels), race/ethnicity (4 levels) SPA (8 levels), gender (2 levels) and age (5

¹ Keeter, S. (1995), *Estimating telephone noncoverage bias from a phone survey*. Public Opinion Quarterly, 59, 196-217.

² Jay, E. D. and DiCamillo, M. *Identifying recent cell phone-only households in RDD surveys*. Paper presented at the 2nd International Conference on Telephone Survey Methodology. Miami, 2006.

levels). The target proportions for these dimensions served as the input data for this procedure and were run on the respondent-level data after the base household weight had been applied. The resultant set of individual respondent-level weights was then identified as the “population weights” in the Adult Survey and Child Survey data files.

Stage 3: Population projections

At the conclusion of the weighting process, the Adult Survey data file was projected to household and population estimates of the total number of residential housing units and total number of non-institutionalized adults residing in Los Angeles County. Similarly, the Child Survey data file was projected to household and population estimates of the total number of residences with children age 0-17 and the total number of children age 0-17 residing in the County.

The total residential housing units for Los Angeles County were based on 2007 California Department of Finance estimates. The population estimates for the Adult Survey were based on the 2006 PEPS for Los Angeles County. Estimates of the number of households with children age 0-17 in Los Angeles County were based on the 2006 Current Population Survey, while estimates of the total population of children age 0-17 in Los Angeles County came from PEPS 2006.

These population projections add to the utility of the survey results in data analysis, since once the data are projected, each survey estimate can be reported as projections to the actual number of adults and children possessing each survey characteristic.

Delivery of Final Data Files

Upon completion of the weighting process, the final survey weights applicable to each respondent record from both the Adult Survey and Child Survey, along with the final data files, were transmitted to the County. The resulting weighted data runs constitute the best estimates of survey response to each question in the Adult Survey and the Child Survey.

2007 LOS ANGELES COUNTY HEALTH SURVEY
 – Adult Screener –

SCREENING QUESTIONS

Hello. I'm _____ and I'm calling on behalf of your Los Angeles County Department of Public Health, whose role is to promote and protect the health of everyone who lives in Los Angeles County. The Department of Public Health is conducting an important survey of County residents.

- We are calling to collect information about the health of County residents to help the Department better serve you.
- Your telephone number was randomly generated by computer.
- We are definitely not selling anything or asking for money.
- The survey is absolutely confidential and the answers given will not be identified with your household in any way.
- If you have any questions about the survey, you may contact the Los Angeles County Department of Public Health at (213) 240-7785.

IF QS10 = 11 OR DON'T KNOW OR QS9 = DON'T KNOW, SAY:

QS12. We can only conduct the interview in English, Spanish, Mandarin or Cantonese, Korean and Vietnamese. Is there another adult in your household who speaks English or one of these languages?

YES..... 1 → ASK TO SPEAK WITH THAT
PERSON AND RETURN TO INTRO

NO..... 2 → TERMINATE

Before we begin, I need to tell you that this call may be monitored by my supervisor to ensure quality and courtesy. If you prefer not to answer any question, please tell me and I will simply go on to the next question.

2007 LOS ANGELES COUNTY HEALTH SURVEY
– Adult Questionnaire –

OVERALL HEALTH STATUS

First, a few questions about your health and general well-being. . .

Q1.	Would you say that in general your health is excellent, very good, good, fair or poor?	EXCELLENT1 VERY GOOD2 GOOD3 FAIR.....4 POOR.....5 DON'T KNOW8 REFUSED9
Q2.	Thinking about your <u>physical</u> health, which includes physical illness and injury, for how many days during the past 30 days was your <u>physical</u> health not good?	_____ DAYS DON'T KNOW 98 REFUSED 99
Q3.	Thinking about your <u>mental</u> health, which includes stress, depression and problems with emotions, for how many days during the past 30 days was your <u>mental</u> health not good?	_____ DAYS DON'T KNOW 98 REFUSED 99
Q4.	During the past 30 days, for about how many days did poor physical or mental health keep you from doing your usual activities, such as self-care, work or recreation?	_____ DAYS DON'T KNOW 98 REFUSED 99
Q5.	GENDER: (INTERVIEWER: IF YOU HAVE ANY DOUBT AS TO RESPONDENT'S GENDER, SAY: Because it is sometimes difficult to determine over the phone, I am asked to confirm whether you are male or female.)	MALE1 FEMALE2
Q6a.	What is your age?	_____ YEARS OLD REFUSED 99

IF REFUSED, ASK:

Q6b. We are only asking this to make sure that we have talked to enough people in each age group. Can you just tell me if you are... (READ CATEGORIES)?	18–241 25–292 30–393 40–444 45–495 50–596 60–647 65 or older8 DO NOT READ → REFUSED9
---	--

IF REFUSED, ASK:

Q6c. Well, can you tell me whether you are under age 65 or not?	YES, UNDER AGE 651 NO, AGE 65 OR OLDER2 REFUSED9
---	--

Q7.	How tall are you?	_____ FEET _____ INCHES DON'T KNOW 98 REFUSED 99
-----	-------------------	---

Q8. How much do you weigh? _____ LBS.
 DON'T KNOW 998
 REFUSED 999

IF Q8 = DON'T KNOW OR REFUSED AND Q7 WAS ANSWERED, ASK:

Q9a. Do you weigh less than (INSERT CRITICAL WEIGHT FOR OBESITY)? YES, WEIGH LESS1
 NO, DON'T WEIGH LESS2
 DON'T KNOW/NOT SURE8
 REFUSED9

IF YES, ASK:

Q9b. Do you weigh less than (INSERT CRITICAL WEIGHT FOR OVERWEIGHT)? YES, WEIGH LESS1
 NO, DON'T WEIGH LESS2

 in this household?

IF ONLY ONE CHILD UNDER AGE 18 IN HOUSEHOLD, ASK:

P1b. So that we can refer to your child by name during the rest of the survey, what is his or her first name? (IF REFUSED) What are his or her initials?	NAME/INITIALS OF CHILD: _____
---	-------------------------------

IF MORE THAN ONE CHILD UNDER AGE 18 IN HOUSEHOLD, ASK:

P2. To keep this interview short, we will only be asking questions about one of your children under age 18 in your household. As a way to select which child to discuss, I would like you to tell me which of your children under age 18 has had the most recent birthday. What is that child's first name? (IF REFUSED) What are his or her initials?	NAME/INITIALS OF CHILD WITH MOST RECENT BIRTHDAY: _____
--	---

IF TWO OR MORE CHILDREN HAVE SAME BIRTHDAY, SAY:

P3a. How many children have the same birthday? _____ CHILDREN REFUSED9

P3b. What are the names of each child? (IF REFUSED) What are the initials of each child?	NAME/INITIALS OF CHILD #1: _____ NAME/INITIALS OF CHILD #2: _____
--	--

SELECT NAME/INITIALS WHICH COMES FIRST IN ALPHABETIC ORDER.

Most of the questions in this survey will be about the health and health care needs of NAME.

P4a. What is NAME's age? (IF LESS THAN ONE, ENTER "0") _____ YEARS OLD
 REFUSED9

IF REFUSED, ASK:

P4b. Can you tell me generally if <u>NAME</u> is age (READ CATEGORIES)?	0 – 2 1 3 – 5 2 6 – 11 3 12 – 17 4 DO NOT READ → REFUSED 9 → TERMINATE
---	--

IF P4a = 0-2 YEARS OR P4b = 0-2 YEARS, ASK:

P5. What is <u>NAME's</u> age in months?	_____ MONTHS OLD (0-35) REFUSED 99
--	---

P6. And, NAME is a (male) (female), is that correct?
 MALE1
 FEMALE2

IF RESPONDENT IS FEMALE AND CHILD IS 0-5 YEARS, ASK :

P7.	Are you <u>NAME</u> 's biological mother?	YES, BIOLOGICAL MOTHER	1
		NO, OTHER	2
		DON'T KNOW	8
		REFUSED	9

INFANT QUESTIONS

IF AGE 0-5, ASK:

IF RESPONDENT IS BIOLOGICAL MOTHER, ASK:

P8.	Before you got pregnant with <u>NAME</u> , did you receive information about any of the following that might help you prepare for pregnancy? (READ ITEMS IN RANDOM ORDER)				
			YES	NO	DK REF
()	a. multi-vitamin or folic (FAH-LIK) acid supplements	1	2	8	9
()	b. healthy weight for pregnancy	1	2	8	9

Estimado residente actual:

Su núcleo familiar ha sido seleccionado al azar para participar en la Encuesta de Salud del Condado de Los Ángeles. El Departamento de Salud Pública del Condado de Los Ángeles realizará esta encuesta, como lo hacemos cada dos años, para saber más sobre la salud de los residentes del condado. Los resultados de la encuesta son muy valiosos para nuestra tarea de promover y proteger la salud de aquéllos que viven en el Condado de Los Ángeles.

Dentro de unas semanas, un entrevistador(a) le llamará por teléfono a su casa en nuestro nombre, y seleccionará un adulto para participar en la encuesta. Esperamos que cuando el entrevistador(a) llame, el adulto seleccionado tome el tiempo necesario para participar en la encuesta. Si llamamos en un momento que no le resulta conveniente, con mucho gusto llamaremos más tarde.

No vendemos nada ni pedimos dinero. Le aseguramos que todas sus respuestas a la encuesta serán absolutamente confidenciales y de ninguna manera se identificarán con su casa. Además le comunicamos que el hecho de que su número de teléfono esté registrado en la lista de “No llamar” (“Do Not Call”) no le excluye de esta encuesta, ya que somos una agencia del gobierno encargada de proteger su salud.

Su núcleo familiar es muy especial porque fue seleccionado al azar y es parte de un muestreo científico que representa todos los núcleos familiares del Condado de Los Ángeles. Su participación es voluntaria y es importante que cada familia seleccionada participe para que la encuesta represente de manera exacta todas las diferentes clases de personas que viven en el condado.

Si tiene alguna pregunta, puede llamar al Departamento de Salud Pública del Condado de Los Ángeles, Oficina de Evaluación de la Salud y Epidemiología (Office of Health Assessment and Epidemiology), al (213) 240-7785, o visite nuestro website: www.lapublichealth.org/ha.

Muchas gracias por su cooperación.

Atentamente,

Jonathan E. Fielding, M.D., M.P.H.
Director y Oficial de Salud

Dear Current Resident,

Your household has been randomly selected to participate in this year’s Los Angeles County Health Survey. The Los Angeles County Department of Public Health is conducting the survey, as we do every two years, to learn more about the health of county residents. The results of the survey are of great value in our efforts to promote and protect the health of all who live in Los Angeles County.

Within the next few weeks, a telephone interviewer working on our behalf will be calling your household and will select one adult to participate in the survey. We hope that when our interviewer calls, the adult selected will take the time to participate in the survey. If we happen to call at an inconvenient time, we will be happy to call back.

We are not selling anything or asking for money. Please be assured that all answers to the survey will remain absolutely confidential and will not be identified with your household in any way. Please also note that having your telephone number listed on the “Do Not Call” list does not exclude you from this survey, as we are a government agency charged with protecting your health.

Your household is very special because it was selected totally at random and is part of a scientific sample representing all households in Los Angeles County. While participation is voluntary, it is important that each selected household participates so that the survey accurately represents a cross-section of all the various kinds of people living in the county.

If you have any questions, please call the Los Angeles County Department of Public Health, Office of Health Assessment and Epidemiology at (213) 240-7785, or see our website: www.lapublichealth.org/ha.

Thank you very much for your assistance.

Sincerely,

Jonathan E. Fielding, M.D., M.P.H.
Director and Health Officer

親愛的居民：

您的家庭被隨機選取參加今年的洛杉磯縣健康調查。本調查由洛杉磯縣公共衛生處舉辦，每兩年一次，以便了解縣內居民的健康狀況。調查結果對我們促進及保護洛杉磯縣全體居民的健康有極大幫助。

在未來數週內，我們的電話調查人員會打電話到您家，並選取您家中一位成人參加調查。希望我們的調查人員打電話給您時，被選取的成人能抽空接受調查。若我們來電時您不方便接聽，我們樂意改天再與您聯絡。

我們並非向您推銷任何產品或索取金錢。我們保證，調查的全部答案絕對保密，並且不會洩露任何您和您家人的相關資料。請注意，不會因為您的電話號碼列在“請勿聯絡”的名單上而被排除在調查之外，因為我們是負責保護您的健康的政府機構。

由於您的家庭是被隨機選取的，所以您以及其他被隨機選取的家庭可以代表洛杉磯縣內的所有家庭。儘管參與調查與否完全由您決定，我們仍希望每一個被選取的家庭都能夠參與調查，以便準確地反映居住在縣內的各類人群的健康狀況。

若有任何疑問，請致電洛杉磯縣公共衛生處衛生評估及流行病學辦公室，電話：(213) 240-7785；或瀏覽本部門網頁：www.lapublichealth.org/ha。

感謝您的合作！

誠懇地，

Jonathan E. Fielding, M.D., M.P.H.
主任兼衛生官員

현재 입주자 님:

귀댁은 금년도 로스앤젤레스 카운티 건강 설문조사에 참여하시도록 무작위로 선정되었습니다. 로스앤젤레스 카운티 보건국은 카운티 주민들의 건강에 대해 더 잘 이해하기 위해 2년마다 설문조사를 실시하고 있습니다. 설문조사 결과는 로스앤젤레스 카운티에 거주하는 모든 주민들의 건강을 증진하고 보호하는 저희의 임무수행에 있어서 중대한 자료가 됩니다.

앞으로 수주 내에 저희를 대신하여 조사를 실시하는 전화 설문조사요원이 귀 가정에 전화를 드려서 설문조사에 참여하실 어른 한 분을 선정할 것입니다. 저희 설문조사요원이 전화를 드릴 때 선정된 분께서 시간을 내셔서 이 조사에 참여하시기를 부탁드립니다. 불편한 시간에 전화를 드린 경우, 다시 전화를 드릴 것입니다.

저희는 무엇을 팔거나 금전을 요구하는 것이 아닙니다. 설문조사에 대한 모든 답변은 절대 비밀로 유지되며 어떤 식으로든 귀댁의 신분이 밝혀지지 않을 것입니다. 저희는 주민의 건강 보호의 임무를 부여받은 정부기관이므로 귀 가정의 전화번호가 “Do Not Call” 목록에 등재되어 있더라도 본 설문조사에서 제외되지 않음을 양지하십시오.

귀댁은 전적으로 무작위로 선출되었으며 로스앤젤레스 카운티 내의 모든 가정들을 대표하는 과학적 표본이므로 매우 중요합니다. 물론 참여는 자발적인 것이지만, 선정된 각 가정이 참여함으로써 설문조사가 카운티 내에 거주하는 다양한 모든 주민들의 단면을 정확히 나타내는 것이 중요합니다.

질문이 있으시면, (213) 240-7785번의 로스앤젤레스 카운티 보건국 보건방역실로 연락하시거나 다음 웹사이트를 방문하십시오：www.lapublichealth.org/ha.

협조하여 주시기를 부탁드립니다.

감사합니다!

Jonathan E. Fielding, M.D., M.P.H.
디렉터 겸 보건담당관

Kính gửi Quý Vị Cư Dân,

Hộ gia đình quý vị đã được lựa chọn ngẫu nhiên để tham gia Cuộc Thăm Dò Ý Kiến về Sức Khỏe của Quận Los Angeles (Los Angeles County Health Survey) trong năm nay. Sở Y Tế Công Đồng Quận Los Angeles (Los Angeles County Department of Public Health) đang tiến hành cuộc thăm dò ý kiến được tổ chức hai năm một lần này để tìm hiểu thêm về tình trạng sức khỏe của các cư dân trong quận. Kết quả của cuộc thăm dò ý kiến rất có giá trị trong việc giúp chúng tôi khuyến khích và bảo vệ sức khỏe cho tất cả các cư dân Quận Los Angeles.

Trong vài tuần tới, một phòng vấn viên qua điện thoại sẽ thay mặt cho chúng tôi gọi tới nhà quý vị và sẽ chọn một người lớn tham gia cuộc thăm dò ý kiến này. Chúng tôi hy vọng rằng khi phòng vấn viên gọi tới, người lớn được lựa chọn sẽ dành thời gian để tham gia. Nếu chúng tôi lỡ gọi tới vào thời điểm không thuận tiện, chúng tôi sẽ sẵn sàng gọi lại sau.

Chúng tôi không chào bán bất kỳ thứ gì và cũng không yêu cầu quý vị quyên góp tiền. Xin quý vị an tâm rằng tất cả các câu trả lời thăm dò ý kiến đều sẽ được tuyệt đối giữ kín và sẽ hoàn toàn không để lộ danh tánh của gia đình quý vị. Cũng xin lưu ý rằng nếu số điện thoại nhà quý vị có tên trong danh sách “Cấm Gọi” (“Do Not Call”), quý vị vẫn có thể tham gia cuộc thăm dò ý kiến này vì chúng tôi là cơ quan chính phủ có trách nhiệm bảo vệ sức khỏe cho quý vị.

Hộ gia đình quý vị là nhân tố đặc biệt vì được tuyển chọn hoàn toàn ngẫu nhiên và là một phần trong mẫu đại diện khách quan cho tất cả các hộ gia đình trong Quận Los Angeles. Mặc dù việc tham gia là tự nguyện, nhưng để cuộc thăm dò ý kiến phản ánh chính xác tất cả các thành phần cư dân khác nhau trong quận, điều quan trọng là mỗi hộ gia đình được lựa chọn cần phải tham gia.

Nếu quý vị có thắc mắc, xin liên lạc với Sở Y Tế Công Đồng Quận Los Angeles, Văn Phòng Đánh Giá Sức Khỏe và Dịch Tế (Office of Health Assessment and Epidemiology) tại số (213) 240-7785, hoặc tới trang mạng điện toán của chúng tôi tại: www.lapublichealth.org/ha.

Xin cảm ơn sự giúp đỡ của quý vị.

Trân trọng,

Jonathan E. Fielding, M.D., M.P.H.
Giám Đốc Kiểm Viên Chức Y Tế
