## I. Introduction

The Los Angeles County Health Survey (LACHS) is an invaluable surveillance and monitoring tool for assessing the health needs and behaviors of County residents, evaluating current programs and initiatives, and planning public health policies for the future. The 2014-15 LACHS was designed to include a representative sample of at least 8,000 adults aged 18+ years and at least 6,000 children aged 0-17 years who reside in Los Angeles County. The Adult and Child Surveys were both designed to include a minimum of 500 interviews in each of Los Angeles County's eight Service Planning Areas (SPAs). The Child Survey was also managed to produce a minimum of 500 interviews with children aged 0-5 years old who reside in First 5 LA's Best Start Communities (BSCs).

The Adult Survey was conducted with a fully overlapping dual frame of landline and cell phone samples, and designed to include at least $21 \%$ of interviews with cell phone only (CPO) households. The Child Survey was also conducted using a fully overlapping dual frame sample in which households were screened for the presence of children, with additional interviews originating from households that completed the Adult Survey and have children. The Child Survey was designed to include a minimum of $20 \%$ of interviews with CPO households.

Sampling procedures generally followed the same methods used for the 2010-11 LACHS, with a few notable exceptions:

- The proportion of Adult and Child Survey interviews completed with cell phone only households was increased to improve representation of the population.
- The increased cell phone only goal for the Child survey required the addition of a Child cell phone RDD supplement, in which cell phone numbers were screened for the presence of children.
- In the Child Survey, we screened for an adult who knew the selected child well enough to answer questions about health, doctor visits, foods eaten, and general activities (sufficiently knowledgeable) to complete the interview rather than the most knowledgeable adult. This was implemented to increase productivity and reduce costs without sacrificing data quality.
- We managed the Child sample to ensure a minimum of 500 interviews about 0 to 5-year-old children were conducted with residents in First 5 LA's Best Start Communities (BSC). Ultimately, this required some oversampling of 0-5 year olds in these areas and additional sample stratification.
- New information was appended to cell phone telephone numbers to evaluate geographic targeting ability and productivity.
- An activity flag that indicated whether the number was active (working and assigned to someone) was used to evaluate the feasibility of oversampling likely working numbers to improve productivity. Ultimately, activity flag information was not used due to concerns over bias.

## II. Populations of Interest and Study Design

## Overview

The 2014-15 Los Angeles County Health Survey (LACHS) was commissioned by the Los Angeles County Department of Public Health (LAC-DPH) and conducted by Abt SRBI Inc., an independent market research and public opinion firm headquartered in New York City. Founded in 1981, Abt SRBI Inc. (formerly Schulman, Ronca and Bucuvalas, Inc.) is a full-service survey research organization with more than 30 years of experience conducting primary data collection for government, universities, non-profit organizations and commercial clients in the field of health.

The 2014-15 LACHS was the seventh iteration of the LACHS study (1997, 1999-2000, 2002-2003, 2005, 2007 and 2010-2011). The LACHS collects information on adults and children in LA County about overall health, health care issues and health indicators of physical and mental well-being. The survey also helps identify key areas to address when planning for the provision of health care to County residents. It is designed to allow the County to develop accurate, reliable measurements for tracking health status, health conditions, access to care, use of available health services, and other health-related behaviors of County residents.

Abt SRBI assisted the Department of Public Health with the design and execution of the 201415 Adult and Child Surveys, including:

- Developing the sampling design and sample management to achieve the desired number of completes in each SPA (Service Planning Area)
- Reviewing and providing recommendations on the survey instruments
- Translating the instruments into Spanish, Cantonese, Mandarin, Korean and Vietnamese
- Programming the instrument into our CATI (Computer Assisted Telephone Interviewing) system for administration by telephone
- Pre-testing the survey instruments
- Data collection (telephone interviewing)
- Data processing and coding
- Development and creation of the statistical weights
- Geocoding address and cross-street information provided during the interview to assign a preliminary SPA and Health District assignment
- Preparation and delivery of all data files and documentation to the County

The LACHS is a population-based random digit dialed telephone survey of adults and children living in households within Los Angeles County, California. Households include single-family homes, townhouses, condominiums, apartments or mobile homes which are occupied by individuals, families, multiple families, extended families, or multiple unrelated individuals. With the inclusion of cell phones, the Los Angeles County population residing in institutionalized and group quarters such as communes, convents/rectories, shelters, halfway houses, dormitories, prisons, jails, juvenile detention facilities, psychiatric hospitals, military barracks, residential treatment programs, nursing homes for the disabled/aged, and the homeless are able to be included in the LACHS.
5|Page

Separate survey instruments are designed to collect data on the adult and child populations:

1. Adult Survey - Collects data about the adult population of LA County among a sample of residents in LA County containing at least 1 adult resident.
2. Child Survey - Collects data on the child population of LA County among a sample of residents containing at least 1 child under 18 years of age.

Probability samples of landline and cellular telephone numbers were used to conduct the surveys. Together, the landline and cellular telephone frames include the household population of Los Angeles County with telephone service. Since the cellular frame is designed to target Los Angeles County residents, out-of-frame cell phone area codes are also excluded from the frame. Using the 2009-13 American Community Survey data for Los Angeles County, we estimate that only $2.1 \%$ of adults live in a household without any telephone service, although this can vary by SPA. The weighting procedures used for both the Adult and Child Surveys make adjustments for non-telephone households to reduce the potential bias from their exclusion from the frame.

## Tracking Completed Interviews by SPA

The Adult and Child surveys were both designed to include a minimum of 500 interviews in each of Los Angeles County's eight SPAs. SPA boundaries are defined by census tract. While respondents cannot accurately report the census tract in which they live, they can provide ZIP code and address or cross-street information. As in the 2010-11 survey, Los Angeles County Department of Public Health (LAC-DPH) provided Abt SRBI with a list of LA County ZIP codes which constituted the ZIP-to-SPA mapping used for estimates during data collection and for final geocoding for select cases. While estimating respondents' SPA were useful in managing sample during data collection, accurate SPA assignments for the final LACHS was done using precise geographic information about the census tract in which the household is located. Maps of Los Angeles County showing the SPA and BSC boundaries compared to ZIP code and census tract, are presented in Figures 1 and 2, respectively.

Figure 1: Los Angeles SPA and BSC Boundaries Compared to ZIP Code

## Los Angeles County Best Start Communities (BSC) <br> Zip Code Overlay

Figure 2: Los Angeles SPA and BSC Boundaries Compared to Census Tract

## Los Angeles County Best Start Communities (BSC) Census Tract Overlay

Census tracts of residence were determined by asking respondents where they live. Abt SRBI uses a "live" geocoding process that operates within our CATI system to code respondent-reported address or cross-streets and assign census tract. In this system, respondent-reported address or cross-streets are submitted to a live, online service that translates this information to latitude and longitude coordinates. If the input fails to find an accurate match, follow-up clarification questions are asked. The system records the accuracy to which the input is geocoded.

## Defining the Sample Frames

We used the same procedures used in 2010-11 to obtain and define the landline and cell phone samples for the 2014-15 LACHS Adult and Child Surveys.

## Landline Frame

The sample of landline telephone numbers was provided by Survey Sampling, Inc. (SSI). The frame was defined by exchanges assigned to Los Angeles County (county FIPS code 06037). A complete file of directory-listed residential numbers from the Donnelley Quality Index3 (DQI3) Database was used by SSI to remove 100-banks from the frame if they contained zero residential listings (0-banks). The resulting frame contained all 100-banks from exchanges that serve LA County with at least one residential listed telephone number (1+banks). All telephone numbers (listed and unlisted) in the 1+banks were eligible for selection. This is known as a list-assisted landline frame.

The list-assisted RDD method is similar to the traditional Mitofsky-Waksberg method of selecting RDD samples (Waksberg 1978 ${ }^{1}$ ). Both methods construct a frame of banks with 100 consecutive telephone numbers. All telephone exchanges classified as providing regular ("POTS") telephone service are used in constructing the 100 banks. The two methods differ in the first stage of sampling, which classifies each bank as either working or nonworking. The Mitofsky-Waksberg method randomly chooses a number from each randomly selected bank. The selected number is dialed; if it is determined to be a household, the bank is considered to be a working bank, and the remaining numbers in the bank are eligible to be sampled. If the selected number is a business, institution, or nonworking number (i.e., an out-of-scope telephone number), the entire bank is considered nonworking and deleted from the sample.

By contrast, the list-assisted method (Tucker et al. 1993²) classifies banks as working or nonworking by comparing them with directory-listed residential numbers. If at least one of the numbers in a bank is a directory-listed residential number, the bank is a working bank and is eligible for sampling; but if the bank contains no directory-listed residential numbers, it is not a working bank (i.e., a zero bank). The list-assisted method is generally thought to be subject to some small coverage bias (because of unlisted residential numbers in banks that contain no listed residential numbers), but this slight bias is offset by gains in survey efficiency and lower cost. The list-assisted method was used for the LACHS.

[^0]9|Page

Known business telephone numbers were purged from the landline sample after selection and before calling attempts were made. This was done by the sample provider, SSI, by comparing the sampled telephone numbers to listed business directories. The landline sample was stratified for the Adult and Child Surveys. Sampled landline telephone numbers were randomly grouped into sets of replicates for controlled release. All records in a replicate were released at one time.

## Cellular Frame

SSI also provided the sample of cellular (or wireless) telephone numbers. The SSI wireless sampling frame begins with 1,000-blocks constructed from exchanges that provide cellular telephone service as designated in the Telecordia Terminating Point Masterfile (TPM). The frame of 1,000 -blocks is then expanded to the 100-block level to identify and remove "mixed use" 100blocks, or those that include landline numbers. The result is a sampling frame of cellular 100blocks that is mutually exclusive of the list-assisted RDD sampling frame. A county FIPS identifier is included for all telephone numbers in the cellular frame, and the cellular frame for the LACHS only included telephone numbers that were assigned to the Los Angeles County FIPS (06037). County FIPS is assigned to cellular numbers based on the rate center of the cell phone exchange.

The cell phone sample was stratified for the Adult and Child Surveys. Telephone numbers were randomly drawn from the cellular sampling frame for the Adult Survey and Child RDD supplemental sample, with each telephone number having a known and equal probability of selection. Sampled cell phone numbers were randomly grouped into sets of replicates for controlled release. All records in a replicate were released at one time and fully dialed according to the call protocol. All telephone numbers from the cellular frame were manually dialed in accordance with laws that prohibit cell numbers from being called by an automated dialer. The sample of cell numbers were processed through SSI's GeoID process to append billing ZIP code (when available) and an activity flag that indicates whether the number is likely to be assigned and working.

## Enhancing Geographic Targeting and Productivity in the Cell Frame

Initially, a county-wide random sample of telephone numbers from the cell frame was drawn for the Adult and Child Surveys. However, two types of information were used to evaluate options for stratification in order to improve geographic targeting ability and productivity: billing ZIP code and the rate center.

Two sources of information are available to geographically target cell phone samples:

1) Rate centers. Rate center represents the geographic area ("rate area") assigned to a telephone exchange (or 1000-bank) for billing purposes. Rate center is not always strongly associated with residence because people do not always get telephone numbers with rate centers where they live and people can move without changing their cell number. Still, rate center approximates the geographic location where the cell number was originally assigned, and while not perfect, it is considered a rough indicator of location.
2) Billing ZIP. Survey Sampling, Inc., the sample vendor, has a GeoID post-selection matching service that appends billing ZIP code (ZIP code where the cell phone bill is sent) for some telephone numbers that became available in 2012. When a cell phone number matches to the database, the accuracy of the geographic location generally performs better than rate centers. However, only a portion of sampled numbers produces a match, and the "match rate" varies substantially by geography.

Abt SRBI used both sources of information to evaluate stratification options in the cell frame. Rate center is used to define the cell phone frame, with rate centers that fall within Los Angeles County included. However, rate center can be used in conjunction with billing ZIP, when available, to explore the degree to which it is possible to target smaller areas within the County such as SPAs or First 5 LA Best Start Communities (BSC). This is done by selecting a county-wide sample of cell phone numbers and submitting the sample to SSI's GeoID process to append billing ZIP code. We then classified records into three "match stratum" groups:

1) Unmatched cases (no billing ZIP code was matched)
2) Matched cases in the target area (e.g., SPA 1 or SPA 5)
3) Matched cases outside the target area (e.g., not SPA 1 or SPA 5)

Once sample records were classified into these groups, a small set of replicates were released and dialed for evaluation purposes. After the replicates were fully dialed, the incidence of living in the target area was calculated for each group separately using screening data.

Often we have found an improved ability to target small areas using billing ZIP code data, and we stratify the sample into these three groups and sample them disproportionately to oversample the target area. However, improvement varies widely based on the specific area being targeted. Individual rate centers also provide geographic information and can be used in conjunction with billing ZIP code to stratify the cell phone sample.

## Activity Flag Experiment

Another recent service available for cell phone samples is appending an "activity flag." Sampled cell phone numbers are flagged based on whether they are active numbers that have been used recently, inactive numbers that are likely to be non-working or not assigned, or unknown. In theory, inactive numbers can be removed from the sample entirely to improve dialing efficiency and reduce costs. At the start of the 2014-15 LACHS, our results suggested activity flags can identify inactive (non-working) numbers from cell phone samples relatively well, although accuracy varied by geography and there was some indication that removing inactive numbers could introduce coverage bias. While the working number rate is substantially lower among records flagged as "inactive," a reasonably high proportion (a third or more) may actually be
working numbers - and respondents reached on these numbers tend to be different in terms of age, education, income, and voter status. ${ }^{3,4}$

For the 2014-15 we conducted an experiment with activity flag data using MSG's Cell-WINS service. An initial set of replicates was analyzed to determine whether the flag accurately identifies non-working numbers, and what bias may be introduced by excluding or undersampling the "inactive" cases. If we had determined the activity flag data could be used to exclude or undersample inactive cases without introducing bias to the sample, we would have proposed to provide a specific strategy to DPH for this undersampling of inactive cases. The conclusion of the analysis was while the number of completed interviews among the inactive flagged records was not large, the data showed the possibility for differences when compared with the numbers classified by as active. Therefore, for the 2014-15 LACHS, the activity flag variable was not used to oversample active cases and undersample inactive cases.

## Adult Survey

The 2014-15 Adult Survey was designed to include a sample of at least 8,000 households, with a minimum of 500 in each of the eight (8) Los Angeles County Service Planning Areas (SPAs), which are defined geographically by census tract. A dual overlapping design was used to conduct the survey, including:
(1) A random-digit-dial (RDD) sample frame of landline telephone numbers in LA County, and
(2) A cross-sectional, RDD cell phone sample frame of telephone numbers from LA County (based on county of the billing office).

The sample design is referred to as "overlapping" because households that have both landline and cell telephone service have a probability of being selected from both frames. The degree of "overlap" between the frames is accounted for in the weight calculations. Telephone numbers from each frame were managed independently.

Screening procedures differed for the landline and cell frames. In households contacted from the landline frame, one adult was randomly selected to participate in the interview. In the cell frame, the adult who answered the phone was invited to participate after determining eligibility since cell phones are generally considered personal, not household, devices.

A total 8,008 Adult LACHS interviews were completed, including 5,026 landline interviews and 2,982 cell interviews ${ }^{5}$. A total of $22.4 \%(n=1,790)$ of all interviews were conducted with cell-only households that do not have a landline telephone. The actual exceeded the design of $21 \%$ cellonly households.

[^1]
## Landline Sample

The landline sample consisted of three strata:

1) a Lancaster and Palmdale (SPA 1) sample of telephone numbers,
2) a SPA 5 sample of telephone numbers, and
3) a sample of telephone numbers from the balance of Los Angeles County.

A pure random sample of ten-digit telephone numbers was drawn from each stratum, with each number having a known and equal probability of being selected (also known as an Equal Probability of Selection Method (EPSEM) sample). For sample release purposes, telephone numbers were grouped into replicates of 500 for the cross-section and 100 for the SPA oversamples, with all telephone numbers in a replicate released at the same time. Although the SPA oversample records overlap with a County cross-section, telephone numbers were drawn from separate sample pulls and deduped as needed.

## Cellular Telephone Sample

An EPSEM sample of telephone numbers was randomly drawn from the cellular sampling frame for the Adult Survey, with each telephone number having a known and equal probability of selection. The sample was randomly assigned into replicates of 500 telephone numbers for sample release purposes, with all telephone numbers in a replicate released at the same time. All telephone numbers from the cellular frame were manually dialed in accordance with laws that prohibit cell numbers from being called by an automated dialer.

When we reached an eligible adult who resided in Los Angeles County from the cellular frame, we attempted to conduct the full Adult Survey with that individual. The cellular telephone was treated as a personal device, not a household device, so the adult who answered the telephone was considered the respondent for the survey instead of randomly selecting an adult from the household as was done in the landline sample.

## Adult Survey Oversampling Design and Interview Goals

The 2014-15 Adult Survey was designed to include a sample of at least 8,000adults, with a minimum of 500 in each of the eight (8) Los Angeles County Service Planning Areas (SPAs).

Using information from DPH's website on the Adult population by SPA, we demonstrated the expected number of interviews by SPA with a straight county-wide sample. The Adult Survey design was as close to a proportional design as possible. Table 1 illustrates a proportional distribution and the estimated modified allocation of interviews by SPA. Only SPA 1 requires oversampling. To develop the estimated modified allocation, we increased the sample size in SPA 1 and proportionally decreased the number of interviews in the other SPAs.

Table 1: Proportional and Estimated Modified Allocation of Adult Interviews by SPA

|  | Adult Population |  | Proportional Design |  | Modified Allocation |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| SPA 1, Antelope Valley | 276,310 | $3.6 \%$ | 292 | $3.6 \%$ | 500 | $6.3 \%$ |
| SPA 2, San Fernando Valley | $1,662,887$ | $21.9 \%$ | 1,755 | $21.9 \%$ | 1,708 | $21.4 \%$ |
| SPA 3, San Gabriel Valley | $1,360,639$ | $18.0 \%$ | 1,437 | $18.0 \%$ | 1,398 | $17.5 \%$ |
| SPA 4, Metro LA | 903,415 | $11.9 \%$ | 954 | $11.9 \%$ | 928 | $11.6 \%$ |
| SPA 5, West | 537,864 | $7.1 \%$ | 568 | $7.1 \%$ | 553 | $6.9 \%$ |
| SPA 6, South | 713,986 | $9.4 \%$ | 754 | $9.4 \%$ | 734 | $9.2 \%$ |
| SPA 7, East | 953,455 | $12.6 \%$ | 1,007 | $12.6 \%$ | 980 | $12.3 \%$ |
| SPA 8, South Bay | $1,168,036$ | $15.4 \%$ | 1,233 | $15.4 \%$ | 1,200 | $15.0 \%$ |
| TOTAL | $\mathbf{7 , 5 7 6 , 5 9 2}$ |  | 8,000 |  | 8,000 |  |

Based on these projections, we planned to use a post-stratum oversample to complete 500 interviews in SPA 1, while proportionally decreasing the number of interviews completed in the other seven SPAs. Targeting was not an option in the cell sample, since cell samples can only be targeted at the county (FIPS) level using county of the billing office ${ }^{6}$. Therefore, only landline telephone numbers were used for the oversample using a limited set of exchanges.

To identify exchanges for the SPA 1 oversample, a report was run showing the number of directory listed telephone numbers in each telephone exchange that fall inside versus outside the census tracts that define the SPA. This allowed us to define a post-stratum in terms of a set of exchanges that overlap with the SPA. The set of telephone exchanges offers a specific level of coverage of the SPA in terms of directory listed numbers and also has a "hit rate," which is the expected incidence of households inside the SPA. The key is to balance coverage with the hit rate. If we included all exchanges that overlap with the SPA, we would have $100 \%$ coverage but the hit rate may be very low and we would get more interviews in other SPAs from the oversample replicates. On the other hand, if we included too few exchanges, the coverage rate will be very low even though the hit rate is high. We typically like to achieve a coverage rate of $80 \%$ unless this will yield a very low hit rate. Exchanges were chosen for the SPA 1 oversample from the Lancaster and Palmdale communities to achieve $81 \%$ coverage with an expected hit rate of $66 \%$, as shown in Appendix I-A.

To determine how many replicates of SPA 1 oversample were needed to reach the target of 500 interviews, the number of interviews completed in each SPA had to be closely monitored during data collection. This was important since interviews were completed from both the landline and cell phone samples, and we did not have an estimate of the distribution of interviews by SPA that would be completed from the cell phone sample. However, classifying interviews by SPA during data collection was a challenge since respondents cannot reliably report in which census tract they live, even though they can readily report ZIP code or address.

Although SPA boundaries are defined by census tract, LAC-DPH provided Abt SRBI with their definitive mapping of ZIP code to SPA. This comprehensive list of 539 ZIP codes provided Abt SRBI with specific guidance regarding the SPA and Health District assignment for survey

[^2]respondents who were not willing to provide full or partial street address information, but were willing to provide this ZIP code. The ZIP-to-SPA mapping is shown in Appendix I-B.

The estimated number of completes by SPA was assessed throughout data collection, and additional SPA 1 oversample replicates were released as needed. Estimates about releasing SPA 1 oversample were made conservatively each time, because releasing more sample than necessary to reach the target number of interviews in SPA 1 would have reduced the sample size in other SPAs and increased study design effects. Since the distribution of interviews by SPA completed from the cell phone sample was unknown, SPA projections needed to be updated frequently based on actual data collected.

## Child Survey

The 2014-15 LACHS Child Survey was designed to include a sample of at least 6,000 LA County households with at least one child under the age of 18 , with a minimum sample size of 500 interviews in each of the eight SPAs. In households with multiple children, one child was randomly selected to be the focus of the survey questions. The survey was completed by an adult who knows the child "well enough to answer questions about his/her health, his/her doctor visits, what kinds of foods he/she eats, and his/her general activities." This is a change from the 201011 iteration of the Child Survey, which screened for the adult who was most knowledgeable about the child.

A total of $5,982^{7}$ Child interviews were completed from four sample sources:

1) Adult Survey Completes from the Landline Frame ( $n=838$ interviews)

- All households that completed the Adult Survey and reported having at least one child under the age of 18 in the household were invited to participate in the Child Survey immediately afterwards. An adult sufficiently knowledgeable, either the original respondent or another adult household member, was invited to complete the Child continuation.

2) Adult Survey Completes from the Cellular Frame ( $\mathrm{n}=694$ interviews)

- If the Adult Survey respondent reported having at least one child under the age of 18 in the household, an adult sufficiently knowledgeable about the focus child was asked to complete the interview.

3) Supplemental Landline RDD Sample ( $n=2,906$ interviews):

- An independent sample of landline RDD telephone numbers was drawn to screen households for the presence of at least one child under the age of 18. After determining household eligibility, an adult in the household sufficiently knowledgeable about the health and daily routines of the focus child was asked to complete the interview.

4) Supplemental Cellular RDD Sample ( $n=1,544$ interviews)
[^3]15 | P age

- This was an independent list of RDD telephone numbers drawn to screen households for the presence of at least one child under the age of 18 . This was not a sample source included in the 2011 survey. After determining eligibility, an adult sufficiently knowledgeable about the health and daily routines of the child was asked to complete the interview.

## Child Survey Oversampling Design and Interview Goals

During the survey design, we proposed a sampling methodology for the 2014-15 LACHS Child Survey similar to the 2010-11 methodology. Child interviews would originate from the Adult Survey with the remaining interviews completed from supplemental samples of landline and cell phone telephone numbers that are screened for the presence of children. A total of at least 6,000 interviews were to be completed with parents, guardians, or adults who are sufficiently knowledgeable about the health of children less than 18 years of age residing with them in Los Angeles County, with at least $20 \%$ of interviews completed with cell phone only (CPO) respondents.

Using NHIS's model-based estimates ${ }^{8}$ for Los Angeles County in 2011, with updates based on regional growth, we estimated the child population that can only be reached by cell phone to be $46.5 \%$ in 2014-15. To balance budget restrictions with sample size needs, a total of at least $20 \%$ of Child interviews were to be completed with cell phone only respondents.

## Supplemental Landline RDD Telephone Sample

The supplemental landline frame for the Child Survey was defined the same way as the Adult Survey landline cross-section: exchanges assigned to Los Angeles County, including 100-banks with 1 or more directory-listed telephone numbers using the list-assisted method (see Landline Sample).

The LACHS started with a largely county-wide cross-section, and we knew we had to oversample SPA $1 \& 5$ to achieve the minimum sample sizes per SPA but then also found that further stratification to target SPAs $4,5,7$, and 8 were necessary as well as complete 500 interviews with $0-5$ year olds from BSCs. The supplemental landline sample for the Child Survey consisted of seven strata, defined by exchanges that were designed to target:

1) a Lancaster and Palmdale (SPA 1) sample of telephone numbers,
2) a SPA 4 sample of telephone numbers,
3) a SPA 5 sample of telephone numbers,
4) a post-stratum sample of telephone numbers from ZIP codes selected to oversample households in SPA 6,
5) a post-stratum sample of telephone numbers from ZIP codes selected to oversample households in SPA 7,
6) a post-stratum sample of telephone numbers from ZIP codes selected to oversample households in SPA 8, and

[^4]7) a sample of telephone number from the balance of Los Angeles County.

A pure random sample of ten-digit telephone numbers was drawn from each stratum with each number having a known and equal probability of being selected. Although the SPA 1, SPA 4 and SPA 5 sample definitions overlap with the original county-wide cross-section, they were drawn from separate sample pulls and deduped with the cross-section as needed. There was no overlap between the SPA 1, SPA 4 and SPA 5 oversamples. Within each stratum, telephone numbers were randomly assigned into replicates, with all telephone numbers in a replicate released at the same time.

The SPA 1 (Lancaster and Palmdale) oversample for the Child Survey was defined the same way as for the Adult Survey. In order to identify telephone exchanges for the SPA 4 and 5 oversamples, census tract-exchange reports were run showing the number of directory listed telephone numbers in each telephone exchange that fall inside versus outside the census tracts that define the SPAs. For SPA 4, exchanges were selected at a $75 \%$ coverage rate (the proportion of listed numbers that fall within the SPA) and a $78 \%$ hit rate (the expected incidence of households inside the SPA). For the SPA 5 oversample, exchanges were selected at an $81 \%$ coverage rate and a $66 \%$ hit rate. These exchange reports can be found in Appendix I-C and as shown in Appendix I-D, respectively.

## Supplement Cell Phone RDD Telephone Sample

While households with children that completed the Adult Survey by cell phone were eligible to complete the Child Survey, it was also necessary to include a supplemental RDD sample of cellular telephone numbers. Initially, we released a county-wide sample of cell phone numbers for the supplemental RDD cell sample. We knew from the 2010-11 survey that the distribution of Child interviews by SPA is similar to the population distribution, which meant both SPA 1 and SPA 5 needed to be oversampled to get a minimum of 500 interviews. This oversample could be achieved, in part, through the Child Survey supplemental landline sample, but we evaluated stratification options to make sure that each SPA had a reasonable cell phone allocation using Rate Center and Billing ZIP as described in Section 1, Enhancements to Cell.

After fully dialing some released replicates, the incidence of living in a target area could be calculated for each group separately using screening data and used to define strata for subsequent sample release.

## Selecting a Focus Child for the Child Survey

The number and age of children was assessed during the Adult Survey, and eligible households were invited to participate in the Child interview at the completion of the Adult Survey. If the respondent who completed the Adult Survey was not sufficiently knowledgeable about the selected child, we asked for a sufficiently knowledgeable adult who resides in the household to continue the interview. In the supplemental landline and cell RDD samples, we first assessed eligibility of the household by completing the screener with an adult and then we asked for the sufficiently knowledgeable adult to complete the interview about the selected child.

In order to ensure the sample of focus children from the Child Survey interview was representative of the population, we randomly selected one child from each household. The Adult Survey questionnaire and the Child Survey screener determined the number of children in each household who are: (1) 12 to 17 years of age, (2) 6 to 11 years of age, and (3) 5 years of age or younger. The children were enumerated as first oldest, second oldest, etc. within each category. We then selected one child to be the focus of the interview. Initially, each child had an equal probability of selection. However, it became necessary to oversample children aged 0 to 5 years among households located in First 5 LA Best Start Community (BSC) areas in order to meet the minimum sample size of 500 for this group. This process was undertaken in December 2014 and executed by using a list moving the household zip code question to the beginning of the Child Survey interview. The zip codes were compared to a list of BSC zip codes provided by LAC-DPH. Respondents believed to reside in a BSC, based on their zip code, who also had a child age 0-5, always had a 0-5 year old child selected for the interview.

## Tracking Completed Child Interviews in Best Start Communities

First 5 LA Best Start Communities (BSC) are defined by census tracts just like SPAs. First 5 LA provided LAC-DPH with a list of census tracts for each BSC. LAC-DPH then determined a census tract to zip code catchment area, and provided a list of zip codes to Abt, SRBI. Since we had the ability to estimate census tracts to assign SPA, we could also code cases that were believed to be completed in BSCs. This was done within the CATI script for cases that provided complete address or cross street information. This coding assisted in the analysis and decision to oversample 0 to 5 year olds in the Child Survey among households located in BSCs.

## III. Questionnaire Development

Separate questionnaires were developed for the 2014-15 LACHS Adult and Child Surveys. The majority of questions in each instrument were taken from previous versions of the LACHS study to support trending over time, or from other well-established and recognized health surveys so comparisons could be made. New questions were also created for both surveys to address emerging areas of interest and importance to the LA County Department of Public Health.

New questions to the 2014-15 LACHS Adult and Child Surveys included:

Adult Survey

The LAC-DPH survey team was responsible for developing initial drafts of the Adult and Child Survey questionnaires. The Abt SRBI project management team reviewed the instruments and provided feedback on question wording, question sequencing, proper skip patterning, and recommendations for additional content. Abt SRBI also ensured that the content, wording and order of the questions would properly screen each household, and that questions necessary for weighting were included so that respondents would clearly understand what they were being asked to do, that the interview could be administered smoothly and efficiently, and that the data collected would ultimately support LAC-DPH's research goals.

## Address Question Wording Change

Early in the course of the main survey data collection, Abt SRBI's project team reviewed the results of respondents providing their address for geocoding, specifically those not receiving an incentive. In consultation with LAC-DPH staff, it was decided alternative wording should be
tested to maximize the number of respondents who provide detailed information to use for the geocoding process.

On September 16, 2014, the revised wording was inserted into the Adult and Child questionnaires and CATI scripts.

## Original Wording, asked prior to September 16, 2014:

We're interested in grouping respondents into geographic areas of the County. Therefore, I would like to get your mailing address. Please know that this information will be held in the strictest confidence and will NOT be shared beyond the research team. Would you be willing to provide this information?

Revised Wording, asked September 16, 2014, and later:
Since LA County is so large and diverse, the Department of Public Health is interested in better assessing the health and well-being of residents at local levels and addressing ways to improve their lives. In order to assist the County, I would like to get your home address. Please know that this information will be kept strictly confidential and will NOT? be shared outside of the research team. Would you be willing to provide your address?

The wording change increased the percentage of respondents who had no monetary incentive to provide their address for geocoding) from $30 \%$ to $37 \%$. The content and results of this experiment were presented as a poster by Amy Lightstone from LAC-DPH and Andrew Evans, Nicole Lee, and Tara Merry from Abt SRBI at the 2015 AAPOR 70 ${ }^{\text {th }}$ Annual Conference.

## IV. Structure and Content of the Adult Survey

The outline of the structure and general content of the 2014-15 LACHS Adult Survey questionnaire is provided below.

## Adult Survey Screener

After explaining that we were calling on behalf of the LAC-DPH to conduct the LACHS Survey, different screening procedures were used for the landline and cell phone samples.

In the landline sample, after reaching an adult aged 18 years or older he/she was asked a series of questions to determine whether the household was located within Los Angeles County and qualified to participate. After confirming household eligibility, an inventory of the adults residing in the household was taken. In households with more than one adult, the CATI program randomly selected one adult to complete the survey based on respondent selection procedures described below. If the CATI program selected a different adult than the individual who answered the screener questions, the interviewer introduced herself/himself and explained the purpose of the call again to the selected respondent. Once the selected adult came on the phone for the
interview, he or she was asked to choose the language in which they preferred to conduct the interview.

Individuals contacted from the cell phone sample were required to confirm residency in LA County, in addition to questions that confirm: (1) the respondent was not currently driving, (2) was at least 18 years of age, (3) that the phone number we had reached was the number we sampled, and (4) that the number we dialed was a cellular phone. Since cell phones are considered personal, not household, devices, the individual who answered was allowed to continue with the interview after successfully answering all the screener questions.

Interviewers who were trained to administer the 2014-15 LACHS were provided with a list of prescripted responses to Frequently Asked Questions (FAQs) to answer any questions about the survey (see Appendix II-A). When requested, interviewers also provided respondents with a contact phone number for the LAC-DPH to verify the legitimacy of the study or ask any other study-related questions that the interviewer could not answer.

## Respondent Selection Procedure

As stated in the previous section, the landline screener questions enumerated adult residents of the household in order to randomly select one adult to be interviewed. In households with only one adult resident, the interview was attempted with that adult. In households with more than one adult, the CATI script applied an equal probability selection of one adult.

In households with two adults, either the respondent who completed the screener questions or the other adult was selected. If the other adult was selected, we asked to speak to him or her directly to recruit participation in the survey, or schedule a callback if needed.

In households with three or more adult residents, the person who completed the screener had the same probability of being selected as any other adult in the household. For example, in a household with three adults, there was a 1 in 3 (33\%) probability that the person who completed the screener would be selected and a 2 in 3 (67\%) probability that another adult would be selected. If the respondent who completed the screener was selected, the interview continued. If another adult was selected, we determined who the selected respondent was by asking for the person who had the "most recent birthday." Once the selected adult was identified, and if available the interview was attempted; if unavailable, all subsequent attempts to contact that household were made with the goal of speaking to and conducting the interview with that adult.

## Adult Survey Main Questionnaire

The Main section of the Adult Survey included a core set of more than 250 questions (although not every question was applicable to or asked of every respondent).

The topic areas that made up the core of the Main section are as follows:

1. Health Status: This set of questions was designed to gauge the overall physical and mental health of the respondent, and includes questions about health-related quality of life.
2. Health Conditions: This section includes questions about physical and/or mental health conditions, including those that had been diagnosed or treated by a health care professional.
3. Mental Health: These questions ask specifically about mental health issues, their impact on the respondent and health impairments or disabilities.
4. Employment and Daily Activities: This section asked about employment status, physical activities that the respondent engaged in, and the degree and duration to which those activities were performed. Respondents age 65 and older are asked about recent falls and how many times falls resulted in injury. This section also includes questions about perceptions of safety and the use of public spaces such as parks and biking trails in the respondent's neighborhood.
5. Health Insurance and Access to Care: These questions ask about current health insurance coverage, barriers to health care, and whether respondents had seen various health care professionals for care.
6. Vaccinations: This section asks whether the respondent received a flu shot or pneumonia shot (for respondents that were aged 65+).
7. Tobacco: These questions ask about the use of tobacco products. Individuals who selfidentified as current tobacco users were asked a series of follow-up questions to assess the amount and frequency of their tobacco use, smoking in the home, and about tobacco cessation and products.
8. Alcohol, Drugs \& Firearms: This section includes questions about the amount and frequency of alcohol use, as well as marijuana and prescription drug use, including having a medical marijuana card. The section also asks about the presence of firearms in the home.
9. Sexual/Reproductive Health: This section asks about current and past sexual behaviors of the respondent, including questions about number of sexual partners (both of the same gender and/or the opposite gender), as well as the use of condoms and other types of pregnancy prevention methods. The section also asks about intimate partner violence and provides a confidential domestic violence telephone hotline for respondents.
10. Demographics: Demographic questions about the respondent and the household include city and ZIP code of residence, origin of birth, citizenship, race/ethnicity/ancestry, gender,
marital status, age, language spoken in the household, disability status, sexual orientation, income, and education.
11. Phone/Cell Phone Usage: This section has questions about the presence and use of landline and cell phones among household members, including the number and type of phones in the household, and the frequency with which they are used to make and receive calls. Responses to these questions were used to develop weighting targets for telephone service groups. This section includes additional demographic questions about access to the Internet, marital status, prescriptions for medical marijuana, sexual orientation and household size/make up. Answers to the number of children in the household determined eligibility for the Child continuation survey.
12. Housing: This section assesses the type of housing in which the respondent lived at the time of the interview and tenure (rented, owned, other) and whether the respondent had ever been homeless.
13. Household Income: This section asks whether household income was above or below poverty level thresholds (i.e. - poverty level, 185\% above poverty level, 200\% above poverty level, $300 \%$ above poverty level, and $400 \%$ above poverty level). Poverty level was calculated for each household based on the total number of adults and the total number of children (under 18 years of age) using Federal Poverty Levels published by the US Census for 2013.
14. Public Assistance/Food Insecurity: This section asks questions to assess the respondent's need for SNAP, the Supplemental Nutrition Assistance Program, and any difficulties they had being able to afford and/or have access to food when they were hungry. This section also includes questions about nutrition education, the proportion of fruits and vegetables in the respondent's diet and where the respondent typically buys groceries.

The main section of the Adult questionnaire concludes with questions about the city/town and ZIP code in which the respondent lives. Respondents from the landline frame were then asked for their home address for the purpose of geocoding the address. Respondents from the cell phone frame were asked for their mailing address to issue their $\$ 10$ incentive. If the mailing address for the incentive was their home address, that address was also used for geocoding otherwise home address or cross-streets were asked for geocoding.

## Additional Questions Asked of Subsamples of Adults

Eight "subsample" modules were also included in the Adult Questionnaire. Each module consisted of a block of questions and was administered to approximately one-eighth of the sample (1,000 interviews). The CATI script randomly assigned each case to one of the eight subsample groups at the beginning of the survey. Each subsample module was programmed at a point within the Adult Questionnaire based on topic to ensure that the survey would flow in a cohesive manner.

The topics of the eight subsample modules are as follows:

1. Street Vendors/Climate Change: The questions in this module ask about the respondent's frequency of eating food from street vendors and/or food carts/trucks, and whether they had ever become sick as a result of eating these foods. This module also included questions about concern about the possible impacts of climate change in Los Angeles.
2. Nutrition: This module assesses support of bans and regulations on food and nutrition that affect children, such as taxes on soda and advertising of sugary foods.
3. Caregiving/Tap Water/Neighborhood: This module asks whether respondents provided care or assistance to an aging adult or an individual with a long-term illness or disability. It also asks about the perceived safety of and usage of tap water, as well as the perceived benefit of fluoride in drinking water.
4. Heat Alerts: In this module, respondents are asked about their behavior and practices during heat alerts to stay cool.
5. Emergency Preparedness/Alcohol Policy/Caregiving: This module asks questions regarding the respondent's preparedness to deal with emergencies or disasters. This module also includes a series of questions about support of bans and regulations related to the sale and use of alcohol.
6. Tobacco Policy 1: This first module asks respondents their opinion about exposure to second-hand smoke and cigarette use by minors, as well as whether or not they favored banning smoking in outdoor areas. There are also questions about whether the respondent was living in subsidized public housing, and a description of the type of housing in which they were living.
7. Tobacco Policy 2: The second Tobacco Policy module consists of a series of agree/disagree statements that cover a wide range of issues related to the sale and use of tobacco products within the County.
8. Child Policy: This module asks a series of agree/disagree statements about issues related to pre-school/pre-kindergarten, awareness of County organizations like First 5LA, sources from which they may have heard about First 5 LA, and topic areas that they may or may not associate with First 5 LA.

The English-language version of the Adult Questionnaire is included in Appendix II-B.

## V. Structure and Content of the Child Survey Questionnaire

## Survey Screener

Eligibility requirements for the Child Survey include residing in LA County and having at least one child under the age of 18 in the household. Child Survey interviews originated from one of two sources: completed Adult Survey interviews or the supplemental landline or cell phone RDD samples. Eligibility was established differently for the two sample sources.

Adult Survey respondents were required to confirm residency in LA County to be eligible for the interview. Because the Adult Survey asks about the presence of children in the household, the interview itself determined eligibility for the Child Survey. However, fully completing the Adult Survey is a third eligibility requirement that is unique to this group only.

In the supplemental landline sample, the interviewer begins by explaining that we were calling to conduct the LACHS Child Survey on behalf of LAC-DPH and asking to speak to an adult. As with the Adult survey, respondents in the cell phone frame are screened for safety and confirmation that we have reached their cell phone. An attempt was then made to screen the household to determine eligibility by asking:

1. If the household was located in LA County, and if so in what city or town, and
2. How many children lived in the household who were: (1) 12 to 17 years of age, (2) 6 to 11 years of age, or (3) 5 years of age or younger.

Once eligible households were identified, a child was chosen at random to be the focus of the survey and we attempted to complete the interview with an adult in the household who was sufficiently knowledgeable about the health and daily routines of the selected child.

## Respondent and Child Selection Procedure

After determining eligibility, the CATI script calculated the total number of children in the household based on answers to questions about the number of children who were: (1) 12 to under 17 years of age, (2) 6 to 11 years of age, and (3) 5 years of age or younger. The CATI script enumerated all children in the household by age group, and order of age within groups. For example, a household with two children in each age category would have a child selected at random.

The selected child was identified to the respondent by age group and position within that group, e.g. second oldest.

In December 2014, in consultation with LAC-DPH, a process of oversampling children 0 to 5 years of age was implemented if the respondent-reported ZIP code indicated the household was likely to be located in a Best Start Community (BSC). This oversampling was necessary in order to
ensure we completed at least 500 interviews with parents/guardians of children 0 to 5 years old living in a BSC.

Once a focus child was selected, we attempted to identify and speak directly with the adult in the household who knew enough to answer questions about the health and daily routines of the focus child. If this required a new adult to be brought to the phone, we determined the language required to communicate with the new respondent and scheduled a callback if necessary. Once the new respondent was on the phone, the interviewer would repeat the introduction and explain the project's purpose and sponsor before confirming that this new adult was knowledgeable about the health and daily routines of the focus child. Once the appropriate adult was identified, we attempted to recruit participation in the Child Survey. For eligible respondents who had also completed the Adult Survey, we administered the Child Survey in the same language as the Adult Survey.

## Child Survey Questionnaire

The Child Survey questionnaire contains over 200 individual questions, though most of these questions were not asked of all respondents. Many questions were only asked in interviews where the selected focus child was 5 years of age or younger. Interviews conducted about a selected child age 6 to 17 years of age were approximately four minutes shorter by comparison. Child interviews that originated from Adult Survey completes were also shorter, as some of the questions had already been answered in the Adult Survey.

The 2014-15 Child Survey included questions on the following topics:

1. Child Identification and Background: This section collects basic information about the focus child to help administer the survey, including the child's name or initials, age, and gender, in addition to the respondent's gender and relationship to the focus child.
2. Infant-Related Questions: This section was administered only if the focus child was aged 5 years or younger, and many questions were only asked if the child's biological mother was interviewed. Questions assess whether the biological mother smoked during pregnancy, experience with breastfeeding in the days and months after birth, the timing of feeding the infant formula and food items besides breast milk, participation in the WIC program, and whether, during the first year after birth, any health professional (e.g., a nurse or social worker) had visited the home to provide information about parenting. .
3. Daily Activities/Family Interaction: These questions were asked if the focus child was aged 5 years or younger: how often family members engage their child in activities such as reading, telling stories Eating meals together was asked of all children ages 0-17 years.
4. Sugar Sweetened Beverages/Sodas \& Screen Time: This question assessed the child's daily consumption sweetened beverages, and usage of television and video games, and computers or smartphones on an average day.
5. Physical Activity: This section begins by asking if the focus child aged 6 years or older participated in any physical activities or exercise in the last week. The section then asks all respondents about their community, including public safety, park spaces, and whether they felt they belonged to their community.
6. Special Health Needs/Disabilities: This section asks about any special medication, treatment or therapy the focus child requires and the impact that the child's condition has on the family's time, finances and daily life. The section also asks about barriers to getting the child's needed care and whether the child was admitted to a hospital in the last year.
7. Child Development Knowledge Statements: This section measures the respondent's knowledge of facts about early child development.
8. Health Conditions: This section asks whether a health professional ever reported that the child had health problems such as autism, diabetes or asthma. Follow-up questions ask how these conditions were being treated. The section also asks if the child received a seasonal flu shot or flu mist.
9. Child Care: For respondents with a focus child aged 5 years or younger, this section asks about childcare arrangements used, difficulties arranging childcare and barriers to finding or keeping regular childcare.
10. Health Insurance: Questions ask about the focus child's current health care coverage, whether the focus child has a regular source of care, and where the respondent seeks health advice for the focus child.
11. Barriers to Accessing Healthcare: This section focused on the respondent's experiences with the ease and/or difficulty of obtaining healthcare for the selected child.
12. Parental Support: This section assessed the respondent's ability to obtain advice or help when it came to raising the focus child, and how often the respondent was impacted by negative emotions, such as lack of interest or feelings of depression. Questions about the respondent's familiarity with and use of the First 5 LA Parent Helpline, as well as their feelings about caring for the focus child were also included.
13. Child Demographics: This series included demographic questions about the focus child such as age, gender, race/ethnicity/ancestry, origin of birth, and length of time in the US and citizen status, when applicable.

## Abt/SRR|

14. Parent Demographics: Many of the questions in this series were also asked in the Adult Survey, and therefore not re-asked in the Child Survey if a valid answer had already been provided. All questions were administered in interviews that originated from the supplemental sample used for the Child Survey. Questions included the respondent's gender, age, race/ethnicity/ancestry, preferred language spoken in their home, origin of birth, length of time in the US and citizen status (when applicable), education level, marital status, sexual orientation, and employment status. Employment status of the respondent's spouse/partner was also determined, if applicable.
15. Other Household Information: Additional information about the household and residents was assessed, including household composition, the number of cell phones in the household and how often they were used, as well as the city and ZIP code of residence. Household income was also determined by asking whether income fell above or below poverty thresholds (i.e. - poverty level, 200\% above poverty level, 300\% above poverty level, and $400 \%$ above poverty level). Poverty level for each household was calculated based on the total number of adults and children (under 18 years of age) using Federal Poverty guidelines published by the US Census for 2010.

The English-language version of the Child Questionnaire is included in Appendix II-C.

## VI. Survey Administration

## Pre-testing and Pilot Test

The LACHS was originally designed to include a separate pre-test and pilot test. A total of 30 Adult and 30 Child Survey pre-test interviews conducted in English only would provide feedback to gauge interview length, determine if revisions were necessary to question wording and/or question order, and assess the general ease of administering the surveys. After the Englishlanguage versions of the Adult and Child Surveys were finalized, they would be translated and a pilot test including 50 Adult and 50 Child Survey interviews would be conducted with a minimum of three in each language. Final recommendations for questionnaire and protocol revisions would be provided based on the pilot test interviews before the start of the main study. Due to constraints and logistics related to funding and the LACHS timeline, the pre-test and pilot test were essentially combined as explained below.

## Adult Survey

The pre-test/pilot test for the Adult Survey was conducted using a sample of landline telephone numbers and began on Thursday, June 5, 2014. The Child Survey questionnaire was not yet finalized; therefore, we could not launch the Adult Survey in the format that was implemented for the main survey with an invitation for qualified households to immediately continue to the Child Survey. Adult Survey interviewing was paused after the shift on Sunday, June 8, 2014, at which time 31 interviews had been completed.

On Friday, June 13, 2014, interviewing for the Adult Survey pretest/pilot resumed including the invitation for eligible households to immediately continue to the Child Survey. Households that had completed the Adult Survey prior to June $13^{\text {th }}$ and were eligible for the Child Survey were called back.

Adult Survey pre-test/pilot test interviewing continued through the evening of Wednesday, June 18. A total of 105 Adult Survey interviews were completed: 93 Adult only, 7 Adults who qualified for the Child Survey, but did not complete it ( 5 terminated, 2 requested to be called back), and 5 households that completed both the Adult and Child interviews. The average length of the Adult interview, measured only among cases that did not qualify for the Child interview (93 cases), was 31.2 minutes (31:12) ${ }^{9}$, roughly six (6) minutes longer than budgeted.

## Child Survey

The Child Survey pre-test/pilot test was conducted using a supplemental RDD sample of cell phone numbers, a new component of the 2014-15 LACHS. Interviewing was conducted between Wednesday, June 11, and Wednesday, June 18. A total of 39 interviews were completed. The

[^5]average length of the Child pretest/pilot interview was 29.8 minutes, approximately 6 minutes longer than the average length of the final Child Survey interview.

## Main Child Survey

During a June 18, 2014, conference call with LAC-DPH, Abt SRBI proposed starting the data collection for the Child Survey in June prior to incorporating any feedback from the pre-test/pilot test in order to meet project timeline requirements. We suggested starting the standalone versions using supplemental samples of landline and cell phone numbers instead of fully implementing the Child Survey continuation from the Adult Survey for efficiency and simplicity. The continuation process from the Adult Survey required additional CATI set-up and Field oversight, making it more difficult to implement. Restricting interviewing to the supplemental sample versions initially also limited the extent of script changes that would be required once the questionnaire was finalized. LAC-DPH agreed to this approach and the Child Supplemental Survey went live on Thursday, June 19. While these interviews were retained for analysis and included in the final sample, they were evaluated in the same way as the pre-test/pilot test interviews.

Interviewing was paused on Monday, June 30, 2014, at which point 497 Child Supplemental Survey interviews were completed. The breakdown by broad categories was:

- Landline: 324
- Cell Phone: 173
- Selected Child Age 12-17: 219
- Selected Child Age 6-11: 161
- Selected Child Age 0-5: 117

The overall average interview length for the Child Supplemental Survey was 28.2 minutes, approximately eight (8) minutes longer than budgeted. By age group, the average interview lengths were:

- 12 to 17: 27.01-27:00
- 6 to 11: 26.66-26:40
- 0 to 5: $32.55-32: 33$

## Lune 2014 LACHS Interview Monitoring Feedback

Approximately sixty-five interviews were monitored by the Abt SRBI project team between live monitoring of interviews and listening to recorded pre-test/pilot interviews. Most of the live interviews were observed in the company of LAC-DPH staff. All recorded pre-test/pilot interviews were uploaded and shared with LAC-DPH staff.

Overall, the Abt SRBI project team concluded that the LACHS interviews ran smoothly. Observed issues generally appeared to be respondent-specific (e.g., a respondent wanted to answer before all response options were read; there was an issue related to the respondent's conduct, not the
question; or a respondent was occasionally confused by a question but a pattern of difficulty understanding the question was not observed). However, a few specific issues were noted.

Adult \& Child Questionnaire:

- Several respondents found the sugar-sweetened beverage question hard to answer. One respondent (who was answering about her daughter) asked "How many ounces are in one of those juice boxes?"
- A few respondents mentioned "less than one a day" or "only a couple during the week" - we believe the additional interviewing briefing in conjunction with new probe and response text for code '97' seems to have improved the question's administration.

## Adult Questionnaire:

- One respondent appeared confused by QN85d (Have you received any nutrition education... Again, please respond "NO" if you learned any of these at a WIC office.): the prompt "Again, please respond "NO" if you learned any of these at a WIC office," received a response of, "Uh... no?" The interviewer re-read the question to respondent, but he still seemed confused.
- An older respondent answered Q89 (I am going to read two statements that people have made about the food situation at their household...) as "No". The interviewer probed several times (it was clear that this was not true for the respondent) and the respondent kept giving different answers.
- Based on one respondent, we cannot claim this is a significant problem for the survey administration. However, one suggestion is to insert the word "Yes," at the beginning of response codes 1 and 2 and insert "No," at the start of response code 3.

Child Questionnaire:

- At C47, item "a", a respondent asked "Care for... is that physically, emotionally or what?". The interviewer probed using the question text and the respondent answered.
- Does DPH have a specific definition in mind? We have administered this question in other surveys without incident, so we do not have a concern; nevertheless this is an observation worth mentioning that we had not previously shared with DPH.
- One respondent was very upset by C63 (Is child of Latino or of Hispanic origin?) and wanted to make sure project staff knew - the mother of the child is Hispanic and the father is not - he did not know how to answer the question - "I never know how to answer that question. Her mother is Hispanic and I am not. She just thinks of herself as a child.")
- While noteworthy, Abt SRBI's project team believed the issue to be an interviewer training matter. Going forward, interviewers were then instructed to remind the respondent, there is no right or wrong answer, we are asking how the child (or the respondent herself/himself in parallel questions) would classify herself/himself. If the respondent was unsure and was not willing to commit to a specific category, interviewers could accept a "Don't Know" or a "Refused" response.

Finally, though we did not experience any respondent reaction, the introduction to the firearms questions made an impression on the project team. Having listened to numerous interviews, the introduction to the firearms section seems to raise a concern that otherwise did not exist in the mind of the respondent. Abt SRBI proposed reading the statement "We are asking these in a health survey because of our interest in firearm-related injuries." could be read only if a respondent raises concern to the interviewer, to avoid biasing respondent answers. LAC-DPH agreed to this edit prior to the start of the main Adult Survey in August 2014.

## Main Survey Interviewing Dates

For the 2014-15 LACHS, Child Survey interviews were conducted from June 19, 2014, through June 2, 2015. LACHS Adult Survey interviews were conducted August 11, 2014, through June 1, 2015.

## Average Length of Interviews

The Adult Survey was specified and budgeted to average 25 minutes in length; the Child Survey was specified and budgeted to average 20 minutes in length.

## Adult Survey Average Length

During the pre-test/pilot test, the Adult Survey averaged just over 31 minutes. In July and August 2014, LADPH and Abt SRBI collaborated to edit the Adult Survey questionnaire and reduce average interview length. After main interviewing began, average interview length was assessed at just over 27 minutes based on approximately 250 Adult interviews. At the end of data collection, the average interview length was 27:28. The average lengths by category were:

- Landline: 26:35
- Cell phone: 29:18
- Subsamp 1: 27:47
- Subsamp 2: 27:22
- Subsamp 3: 27:38
- Subsamp 4: 26:59
- Subsamp 5: 28:07
- Subsamp 6: 28:01
- Subsamp 7: 27:06
- Subsamp 8: 26:46

## Child Survey Average Length

During the pre-test/pilot test and June start of the main survey, the Child Survey interview averaged approximately 28 minutes. During the month of July 2014, LAC-DPH worked with Abt SRBI to edit the Child Survey questionnaire in order to reduce the interview length. When data collection resumed on July 24, 2014, the average interview length for the Child Survey was estimated to be approximately 22 minutes based on 100 interviews. By the end of data collection, the average interview length was 23:47. The average lengths by category were:

- Landline: 22:25
- Cell phone: 26:14
- Selected Child age 0-5: 26:38
- Selected Child age 6-11: 22:40
- Selected Child age 12-17: 22:35

## Survey Languages

Residents of LA County are racially and ethnically diverse, with large populations of Hispanics/Latinos and Asians. A notable percentage of these Hispanic and Asian residents speak little or no English. To ensure these populations could be included in the 2014-15 Adult and Child Surveys, both were administered in five non-English languages: Spanish, Cantonese, Mandarin, Korean, and Vietnamese.

The percent of interviews completed in each language for the Adult and Child Surveys is shown in Table 2.

Table 2: Adult and Child Survey Interviews by Language

| Language | Adult Survey |  | Child Survey |  |
| :--- | :---: | :---: | :---: | :---: |
| English | 6,820 | $85.2 \%$ | 4,647 | $77.7 \%$ |
| Spanish | 991 | $12.4 \%$ | 1,244 | $20.8 \%$ |
| Cantonese | 40 | $0.5 \%$ | 22 | $0.4 \%$ |
| Mandarin | 91 | $1.1 \%$ | 40 | $0.7 \%$ |
| Vietnamese | 26 | $0.3 \%$ | 18 | $0.3 \%$ |
| Korean | 40 | $0.5 \%$ | 11 | $0.2 \%$ |
| TOTAL | $\mathbf{8 , 0 0 8}$ | $\mathbf{1 0 0 . 0 \%}$ | $\mathbf{5 , 9 8 2}$ | $\mathbf{1 0 0 . 0 \%}$ |

English and Spanish surveys were administered directly in the CATI program. Cantonese, Mandarin, Vietnamese, and Korean interviews were administered using the paper questionnaire, with answers entered directly into the CATI program while following along an English version of the interview.

Translation and Translation Review
After the English-language versions of the Adult and Child Surveys were finalized, both surveys were translated into each of the additional five languages in which the survey was offered. The questionnaires were translated by G3 Translate, a New York City-based firm that had the ability to translate into all five languages. The translated versions of the 2010-11 LACHS survey questionnaires were provided to the vendor to ensure that the existing translation would be used for questions that were identical to the 2010-11 survey. To facilitate this process, the 2014-15 English-language versions of the questionnaires were marked-up to indicate which questions were unchanged from the 2010-11 surveys. The marked-up questionnaires were provided to the translation vendor.

For each language, translations of the Adult and Child Surveys were reviewed independently by an Abt SRBI staff member who was fluent in that language. For the Spanish-language translations, an in-house linguistics expert who is fluent in Spanish reviewed the surveys. The translations for each of the Asian-language surveys were reviewed by a bilingual interviewer who specialized in the administration of surveys in that particular Asian language. These independent reviewers provided feedback on any problems or issues with the translation, and their comments were shared with the translation vendor to review. All issues were either corrected in the translation, or the vendor provided an acceptable justification of why no change should be made. Vendor changes and comments were shared with the reviewers, and the process continued until a consensus was reached that all translations were accurate. Once the translated surveys were finalized, a different translator (at the same vendor organization) back-translated the instruments into English for all five languages for both the Adult and Child Surveys. The English back-translations were compared to the original English version to identify any additional issues, which were discussed with the translation vendor and reviewers until a consensus was reached that the translations were accurate. The translated versions were then provided to LAC-DPH where staff fluent in these languages completed their review. Edits and feedback were provided to Abt SRBI, and.....

## Sample Management

The sample was managed to complete the desired number of interviews overall and in each SPA while achieving the highest response rate possible. This was done by releasing sample in batches of replicates, ensuring released sample was fully dialed according to the call protocol, monitoring refusal conversion efforts, and periodically assessing productivity to estimate the amount of sample needed to reach quotas before releasing additional sample replicates.

## Call Design and Protocol

Initially, telephone numbers were given a maximum of 14 call attempts for both the Adult and Child Surveys. Cases that completed the Adult Survey and were eligible to complete the Child Survey were given up to 14 additional attempts (for up to 28 attempts total). A small percentage of cases received more than 14 attempts to follow-through on callback appointments and
maximize response rate. However, the call protocol was modified partway through the field period as described below. Telephone numbers were dialed until they achieved a terminal disposition or reached maximum attempts based on the current protocol.

In an effort to improve efficiency and offset higher costs resulting from longer than budgeted interview lengths for the Adult and Child Surveys, Abt SRBI and LAC-DPH agreed to reduce the call protocol late in the data collection period (April 1, 2015). Maximum call attempts were decreased for non-qualified cases from 14 to 10 in the landline frame and from 14 to 8 in the cell phone frame, leaving the full call protocol in place for qualified cases.

- For the Adult Survey, a qualified case was one where we confirmed LA County residence, selected the qualified respondent (landline households), and were about to administer Q1. Adult Survey respondents who qualified for and agreed to continue and participate in the Child Survey continued to receive up to 14 additional attempts in order to complete the Child Survey continuation interview.
- For the Child Survey, a qualified case was one where we confirmed LA County residence, determined there was a child age 0 to 17 living in the household, selected a child and a sufficiently knowledgeable respondent, and obtained the selected child's name or initials.

Reducing the number of call attempts had only a small effect on the overall composition of the unweighted sample. This was largely due to the fact that only a small proportion of surveys are completed with cases that were not qualified by the time they reached 10 (in landline) or 8 (in cell phone) attempts ( 0.7 to $1.3 \%$ ). While respondents surveyed in later attempts did have a slightly different distribution on some characteristics, the differences were not meaningfully large.

Outbound calls for LACHS were concentrated in the core dialing windows below.

- Weeknights 5PM-9PM ${ }^{10}$
- Saturdays 10AM-4PM
- Sundays 1 PM to 5 PM and 5 PM to 9 PM

If contact was not established during the regular dialing windows, landline numbers were also called on weekdays during the day (roughly noon to 5 pm ) on the 6th and 11th attempts. This schedule ensures that calls are made to households at different times of the day to maximize the chance of reaching the household.

Messages were left the first time a voicemail/answering machine message was encountered and then on every third subsequent voicemail/answering machine message. The following answering machine messages were used:

## Landline

"Hello, I'm calling on behalf of your Los Angeles County Department of Public Health.
This is not a sales call. We are conducting an important survey of County residents. If

[^6]you have any questions about the survey, you may contact the Los Angeles County Department of Public Health at 213-240-7785. We will try reaching you another time."

## Cell

"Hello, I'm calling on behalf of your Los Angeles County Department of Public Health. This is not a sales call. We are conducting an important survey of County residents. If you qualify, you will be reimbursed for time spent answering our questions on your cell phone. If you have any questions about the survey, you may contact the Los Angeles County Department of Public Health at 213-240-7785. We will try reaching you another time."

An LAC-DPH telephone number was programmed to be displayed on caller ID for calls made to landline phones for this survey. This was done so that households would reach the LAC-DPH if the number was called back to inquire about the purpose of our call. Caller ID display is controlled by our automated dialers, which were not used to call cell phone numbers in accordance with Federal laws. Therefore, the LAC-DPH number was only displayed on calls to landline phones ${ }^{11}$.

## Refusal and Refusal Conversion Procedures

Initial refusals by the household or respondent were classified as "soft" or "hard" (harsh) refusals. Hard refusals were not called again. Soft refusals were called again by an interviewer trained in refusal conversion techniques to try and gain cooperation of the household/individual. If the household or individual was reached and refused a second time, no further calls were made.

Late in the data collection period (April 1, 2015) Abt SRBI and LAC-DPH agreed to stop refusal conversion efforts in the cell phone sample. The decision was made to improve production efficiency of the cell phone sample and balance increased costs due to the longer than budgeted interview lengths for both the Adult and Child Surveys.

## Incentives

Respondents who completed only the Adult interview on a landline phone or only the Child interview from the supplemental landline sample were not offered an incentive. A \$10 incentive was offered to: respondents who completed the Adult interview or Child interview by cell phone; and those who completed the Child interview after completing the Adult interview on a landline. Those who completed both the Adult and Child interviews on a cell phone were offered a total of $\$ 20$.

[^7]
## VII. Final Data Preparation

## Data Processing

Data for the Adult and Child Surveys were processed periodically throughout data collection. Processing involved a compilation of completed interview cases for review by the Project Manager.

After interviewing was complete, a final un-coded data set was compiled for each of the Adult and Child Surveys in SAS format that contained completed interviews only. For the 2014-15 LACHS, DPH staff reviewed and coded the survey respondents' verbatim responses.

Initial geocoding results were also provided to LAC-DPH based on results from a process using reviewed and cleaned respondent-reported address or cross-street information to estimate latitude and longitude coordinates by connecting to a live map server. Cases were assigned into census tract, Health District, and one of the eight SPAs. Separate Excel files with these preliminary geocoding results, address and cross-street information were sent to LAC-DPH. LAC-DPH used these files to review Abt SRBI's results and geocode all cases and assign SPA following the same procedures used for previous surveys. This process identified 48 Adult and 48 Child survey cases that were not in LA County and were therefore removed from the final analytic dataset.

## Geocoding

Home address and cross-street information was collected from respondents for coding SPA and Health District. The geocoding process used for the 2014-15 LACHS was based on the process used for the 2010-11 LACHS and included three phases

1. Geocoding. For consistency with the 2010-11 LACHS, cases were initially grouped into following categories based on the amount of data available for geocoding:
a) Records with detailed street address or cross-streets, city and zip code
b) Records with street name only (no street number), or records with two parallel streets
c) Records with ZIP code data only
d) Records with city data only
e) Records with city and ZIP code data only
f) Records without any address information at all

## 2. Geocoding Quality Review

## 3. Assignment of geocoded locations to areas

The following GIS files were used for the 2014-15 LACHS project geocoding and area assignments:

SPA 2012 (downloaded 9/12/2014)
http://egis3.lacounty.gov/dataportal/2012/03/01/service-planning-areas-spa-2012/

Health Districts 2012 (downloaded 9/12/2014)
http://egis3.lacounty.gov/dataportal/2012/03/01/health-districts-hd-2012/

CAMS Address Locator files (transferred to Abt SRBI via SFTP 10/2/2014)

- CAMS_ADDRESS_LINES.shp
- CAMS_ADDRESS_POINTS.shp
- CAMS_INTERSECT.loc
- CAMS_POINTS.loc
- CAMS_STREETS.Ioc
- CAMS_LOCATOR.loc

In order to be consistent with geocoding from previous years of the LACHS, Abt SRBI used the coordinate system: PCS: NAD 1983 StatePlane California V FIPS 0405 Feet. ${ }^{12}$ Census Tract 2010 file (transferred to Abt SRBI via SFTP 10/2/2014)

- Census_Tract_2014.zip

Updated ZIP Codes file (transferred to Abt SRBI via SFTP 10/2/2014)

- zipcodepoints_rev100114_SPAHD2012.xls
- zipcodepoints_rev100114.zip

First 5 LA County Best Start Communities BSC (transferred to Abt SRBI via SFTP 10/3/2014)

- BSC zip codes 2014 ohae to Abt.xlsx

The following points detail the procedures accordingly for geocoding and locational assignments:

## 1) Geocoding

a) Records with detailed street address or cross-streets, city and ZIP code.

Example: "5400 Russell Ave, Los Angeles, CA 90027"
Example: "Russell Ave \& N Harvard Blvd, Los Angeles, CA 90027"

As noted in the "2011 Geocoding Process" instructions, ESRI ArcGIS software (ArcMap) was utilized for geocoding. Abt SRBI GIS has the latest full suite of ESRI ArcGIS software including both ESRI ArcMap 10.1 and 10.2, and ESRI ArcGIS Server. For the 2014-15 LACHS real-time geocoding process Abt SRBI GIS downloaded the "LA County Street Centerline Address File" and built an "Address Locator" using ArcGIS software. This Address locator was then published on our secured ArcGIS Server 10.1 and utilized for real-time CATI geocoding during data collection. The latest LA County Street Centerline file was downloaded from the LA County GIS Data Portal.

[^8]LAC-DPH provided Abt SRBI with their Countywide Address Management System (CAMS) Locator files. Abt SRBI's GIS professionals used the CAMS Locator for geocoding street address and cross-street data. LAC-DPH made the following settings: a spelling sensitivity of 80 , a minimum match score of 85 , and a minimum candidate score of 83 .

Street address and cross-street cases that are not successfully coded by DPH's CAMS Locator will be run through Bing Maps API, in the hopes of finding a match. DPH would like Abt SRBI to run any cases matched through Bing Maps to have their addresses run through their CAMS Locator to confirm the match and use the CAMS's longitude/latitude location.

## b) Records with street name only (no street number), or records with two parallel streets

Example: "Olympic Blvd, Los Angeles"
Example: "Mayberry Street, 90026"
Example: "Minnesota St \& Altura St, Los Angeles"
Since 2011, geocoding technology has improved dramatically with free "Application Program Interface (API)s" available for online advanced geocoding. Abt SRBI GIS has extensive experience in the use of Python language programming (https://pypi.python.org ) to interact with the available geocoding APIs. Based on our experience, the "Microsoft Bing Maps API" was recommended for use for the LACHS based on reliability and precision in geocoding. The cases geocoded via Bing Maps API were flagged in the LACHS data set.

For step "1b", all records missing full complete addresses, such as missing house numbers, or providing single or parallel streets only, the Bing Maps geocoding API was used. All records in this category were passed through the Bing Maps geocoding API and examined for output results. A "precision" field for all geocoded addresses was included by the Bing Maps API to indicate the level of geocoding to a specific address, intersection, ZIP code only, and city only. Records in this category " 1 b " are streets; thus, only output with street addresses or streets geocoding were accepted and reviewed. Outputs of lower quality geocoding precision to ZIP code or cities only were treated as ungeocoded records.

Since streets in the LA County area can be many miles long through various neighborhoods and unique census tracts, use of the Bing Maps API standardizes and geocodes all the street geocoding to the same "centroid" or center point of the street. For example, if "W Pico Blvd, Los Angeles, CA" is entered in the Bing Maps API geocoder, it will always return the same precise coordinates in the center of "W Pico Blvd" each time. Therefore unique input records with the same street names throughout the project were geocoded in an identical manner accordingly. Further information in the final relocation and "assignment to the Health Districts, SPA, and BSC areas" (memo
point 3) detail how the records will then be balanced between census tracts along streets, as noted in the 2011 document.

## c) Records with ZIP code data only

Example: "90008"

## d) Records with city data only

Example: "Culver City"

## e) Records with city and ZIP code data only

Example: "Los Angeles, CA, 90016"

For records with any city and/or ZIP code data only, Abt SRBI used the ZIP code lists provided by LAC-DPH in order to code the record into the appropriate SPA, Health District, and BSC. The SPA and Health District coding were completed using the file "zipcodepoints_rev100114_SPAHD2012.xlsx". The BSC coding was done using "BSC zip codes 2014 ohae to Abt.xlsx" as the source file. The Excel files from LAC-DPH did not include ZIP code centroid points; therefore, no latitude and longitude were assigned to cases with ZIP code only or ZIP code and city name only.

For survey records provided with city name only, for example "Inglewood", DPH's ZIP code file (zipcodepoints_rev100114_SPAHD2012.xlsx) lists fourteen ZIP codes associated with "Inglewood", covering two different HD districts, and two different SPAs. LAC- DPH and Abt SRBI have agreed that Abt SRBI will send such cases to LAC-DPH, relying on their local expertise, for geocoding resolution.

## f) Records without any address information at all <br> Example: "My house"

Records with no usable address information provided were flagged for random assignment. The process of random assignment was performed by LAC-DPH staff. After random assignment to a location, the Health Districts, SPA and BSC areas were assigned accordingly.

## 2) Geocoding Quality Review

After each data category was geocoded according to the methods detailed above, by Abt SRBI, a series of quality checks and manual geocoding were completed. The quality checks were as follows:
a) A comparison of the addresses provided in both the child and adult surveys, and in various points of the survey. These addresses were compared and reconciled, and the various addresses used in combination to improve overall geocoding quality. All similar
addresses for the same household were geocoded identically.
b) Comparisons were completed of the input address precision to the output geocoded address precision. Records of full complete addresses were geocoded to house number with full street address only. Records with street name only were geocoded to street name centroids only. Records with ZIP code and/or city only were geocoded to ZIP code and/or city only.
c) A Bing Maps "flag" variable was added to the data set for all cases that utilized the Bing Maps locator.
d) Using ArcMap GIS software for visual inspection of the geocoded dataset, all geocoded address points were mapped and visualized for ZIP codes and city names and compared with the LA County ZIP code and city boundaries. Discrepancies between input ZIP code and/or city and output ZIP code and/or city were flagged. Locations geocoded outside of the LA County were flagged.
e) Cases geocoded via the software that, based on the reported street address or crossstreet, are returned with an address containing a ZIP code different than the one provided by the respondent (i.e. input/output ZIP code) were flagged in the variable 'Input_Output_Zip'. These cases were not assigned X, Y coordinates. They were sent to LADPH for review and a determination of the appropriate coordinate assignment.
f) Cases with only a ZIP code, only a city, or only a ZIP code and a city were reviewed to ensure these variables are provided in geocoded data files provided to LAC-DPH.
g) All cases in need of manual geocoding were flagged as deemed appropriate and sent to LAC-DPH for review and determination of the best possible geocoding.
h) All records with no address data and any remaining ungeocoded records were randomly assigned ("hot deck" process, completed by LAC-DPH).
i) Final tabular checks were run on the final dataset, such as sorting by latitude and longitude coordinates to confirm correct data range. Geocoding precision of full street address, street number or ZIP code / city only were sorted, examined and compared to the input data. Matched addresses were compared to the original input addresses. A manual review of all records will occur outside of GIS software for data consistency.

## 3) Assignment of geocoded locations to areas

After all geocoding and quality reviews were completed, the assignment of the geocoded coordinates to the areas was completed. The following GIS files were used for assignment:

First 5 LA County Best Start Communities BSC (transferred to Abt SRBI via SFTP 10/3/2014) BSC zip codes 2014 ohae to Abt.xlsx

As noted previously, the final assignment process is dependent on the input address data type:
a) For full complete addresses (house number, street, city and ZIP code) geocoded using the CAMS Locator (as noted in section "1a"), the ESRI "Spatial Join" tool was used to assign the coordinates to the areas (Health Districts, SPA and BSC) by location.
b) For the street only addresses (as noted in section " 1 b "), the previously assigned coordinates from the Bing Maps API geocoder were examined for the street length and balanced between the tracts the street passes through within the ZIP code and city provided by the respondent. For example, if there were four Census Tracts that a street passes through in the given ZIP code and city, the case was randomly assigned to one of the four tracts and then assigned to the appropriate regional area (SPA, Health District, and BSC).
c) City and/or ZIP only data (as noted in sections " 1 c ", " 1 d ", and " 1 e ") were assigned to SPA and Health District areas via the DPH's provided list of 539 zip codes in LA County. These cases were assigned to a BSC based on the 55 ZIP codes provided by DPH (BSC ZIP codes 2014 ohae to Abt.xIsx).
d) Records requiring DPH review were sent to LAC-DPH via secure FTP for geocoding. As the local experts, DPH determined the appropriate geocoding for each record and returned their geocoded data to Abt SRBI via the FTP site. These data were incorporated into the final LACHS data.
e) Ungeocoded records (as noted in section " $1 f^{\prime \prime}$ ) were randomly assigned, via developed "hot deck" procedures, and then coded, from the newly assigned coordinate locations, to the corresponding areas (Health Districts, SPA or BSC) of the new coordinates chosen.

The final geocoded file contained the following variables for all records:

- GEO_CITY (corrected city)
- GEO_ZIP (corrected ZIP code)
- GEO_STREET (corrected street data)
- GEO_PRECISION (level of geocoding)
- X (x-coordinate)
- Y (y-coordinate)
- CENTROID_FLAG (indicating coordinates based on zip code centroid)
- GEO_CT (census tract 2010)
- GEO_HD (Health District 2012, Numeric)
- GEO_HD_NAME (Health District 2012, Character)
- GEO_SPA (Service Planning Area 2012, Numeric)
- GEO_SPA_NAME (Service Planning Area 2012, Character)
- GEO_BSC (First 5 LA Best Start Community 2014, Numeric)
- GEO_BSC_NAME (First 5 LA Best Start Community 2014, Character)
- IMPUTATION_FLAG (indicating imputed HDs and SPAs via hot deck procedures)
- Bing_Maps_Flag (for cases that are coded via Bing Maps API - added for the 2014-15 LACHS)
- LA_County (Flag for cases that fall outside of LA County, a value of ' 1 ' indicated the case is not in Los Angeles County.)
- Input_Output_Zip (Flag for cases that are returned with a different output ZIP code than was input. A value of ' 1 ' indicated cases meeting this criteria.)

At the conclusion of Abt's geocoding, all records that were not geocoded or that were geocoded using Bing API were sent to LAC-DPH for review. LAC-DPH staff manually geocoded those records and assigned them, where possible to $x, y$ coordinates and/or census tracts, and at least a minimum to appropriate Health Districts and Service Planning Areas (Appendix XX).

Summary of the Final Level of Geocoded Data

| Categories | Overall |  | Adult Survey |  | Child Survey |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | N | \% ${ }^{\text {a }}$ | N | \% ${ }^{\text {a }}$ | N | \% ${ }^{\text {a }}$ |
| Total Records | 12,544 |  | 8,056 |  | 6,030 |  |
| Outside of LA County | 86 |  | 48 |  | 48 |  |
| Within LA County ${ }^{\text {b }}$ | 12,458 |  | 8,008 |  | 5,982 |  |
| Detailed Street Address or CrossStreets ${ }^{\text {c }}$ | 7,262 | 58.3\% | 4,211 | 52.6\% | 4,388 | 68.6\% |
| Street Name Only or Parallel Streets ${ }^{\text {c }}$ | 1,056 | 8.5\% | 684 | 8.5\% | 437 | 8.4\% |
| City Only | 53 | 0.4\% | 42 | 0.5\% | 13 | 0.2\% |
| City \& Zip Only ${ }^{\text {d }}$ | 4,021 | 32.3\% | 3,013 | 37.6\% | 1,134 | 22.7\% |
| No Address Information | 66 | 0.5\% | 58 | 0.7\% | 10 | 0.2\% |

${ }^{a}$ Among records within LA County.
${ }^{\text {b }}$ Categories of "Detailed Street Address or Cross Streets" and "Street Name Only or Parallel Streets" were geocoded to the census tract level, while categories of "City Only," "City \& Zip Only," and "No Address Information" were geocoded to the Health District level.
${ }^{\text {c E Exact }} \mathrm{x}, \mathrm{y}$ coordinates were assigned.
${ }^{d} X, Y$ coordinates of zip code centroids were assigned.
The collaborative geocoding effort between LAC-DPH and Abt SRBI produced the following results:

- In the adult survey, $61 \%$ were assigned $\mathrm{x}, \mathrm{y}$ coordinates and census tracts.
- In the child survey, $81 \%$ were assigned x , y coordinates and census tracts.

## VIII. Response Rate and Disposition of Call Attempts

The underlying principle in the calculation of a standardized AAPOR response rate is full disclosure of the method used to calculate the response rate. There are many ways to calculate a survey response rate, as surveys differ and there are alternative ways of thinking about and coding final dispositions.

The 2014-15 LACHS response rate calculations are based on the most current AAPOR Standard Definitions which were revised in April $2015^{13}$.

## Call Disposition Process

During data collection, each call is given a disposition that reflects the outcome of that call. Landline calls may be dispositioned by either the automated dialer (e.g., not in service, busy signal, no answer, etc.) or by interviewers (e.g., callback, refusal, business number, etc.). All calls to cell phones are dispositioned by interviewers. The disposition for each call attempt is recorded and stored in the sample management system (SMS) by a sample ID number. The cumulative history of dispositions for all call attempts are used to assign a single, interim disposition for each sample record. The interim disposition codes are assigned to a priority level when generating the interim (weekly status) or final disposition reports:

1=live-non-contact
2=callback
3=refusal
4=completes/resolved (e.g. non-working phones, hard refusals, ineligible phones, businesses, records that have reached their maximum number of call attempts).

The priority level determines what disposition appears on the disposition report based on the following rules:

- Completes/resolved (4) stay that way unless they are dialed again. If they are dialed again the priority level is reset. For example, sometimes records resolved as nonworking or over maximum attempts are called again. This may be done in order to complete a few extra interviews without having to release fresh sample. The field duration of the survey, may make it reasonable to confirm records that were once nonworking are still non-working.
- Refusals (3) keep the last refusal dispo, unless they become completes/deads (4).
- Callbacks (2) keep the last callback dispo, unless they become refusals (3) or completes/deads (4).

[^9]- Live-non-contacts (1) use the last live non-contact dispo unless they have become callbacks (2), refusals (3) or completes/deads (4).

## Calculating Final Disposition Codes from the Case-level Call History

Prior to assigning each record a final, standard AAPOR disposition code, we made several adjustments to some of the records that were dialed in the LACHS samples:

- Defined and identified partial completes and assigned them to a distinct disposition code.
- Identified cases with some data, but not enough to count as Partials, and coded them as Break-Offs.
- Identified those "Break-offs" which also contained a "Refusal" disposition and assigned them to a distinct disposition code of Refusal and Breakoff.
- Identified those cases which provided an answer of "Don’t Know" or "Refused" to one of the Screening questions and assigned them to a distinct disposition code of Refusals to answer screening questions.

## Completes

Completed interviews are those cases with a recorded response to the last survey item within the respective version (i.e. Adult Survey or Child Survey).

## Partial Completes

Some cases did not answer enough questions to be considered completes, but did answer enough to be counted as "Partial Completes." While AAPOR guidelines do not provide specific rules for defining Partials, they do require the criteria used to be documented. We developed criteria for Partials based on the definition used for the 2010-11 LACHS.

## Adult Survey Criteria:

Cases with an answer to question "q38" ("During the PAST 12 MONTHS, have you had a regular seasonal flu shot or the flu mist that is sprayed in your nose?") that are not Completes were recoded as a "Partial Complete." This question was selected due to the fact that it is the mid-point of all the commonly asked questions, excluding the Screener/Respondent Selection (i.e. CS1 through S14) and Address Module questions (i.e. all questions after q91). Having answered at least up to question q38 would indicate that a respondent had completed a minimum of $50 \%$ of the questions common to all respondents of the Adult Survey.

## Child Survey Criteria:

Similar to the criteria used for the Adult Survey, we identified Partial Completes within the Child Survey as those cases that did not complete the Child Survey, but answered a minimum of $50 \%$ of the questions that were common to all respondents of the Child Survey. The question within the Child Survey which was identified as being the midpoint of the commonly asked questions was question "c53" ("Overall, how easy or difficult is it for (child) to get medical care when (he/she) needs it?").

## Break-Offs

We have also flagged cases that terminated in the questionnaire, but do not have enough data to count as Partials, as Break-Offs. Cases identified as "Break-Offs" which also had a disposition status of "Refused" were recoded into the "Refusal and Break-off" category in the AAPOR disposition.

## Adult Survey Criteria:

Cases that (1) qualified for the survey (any household with adults (landline) or adult (cell phone) located in LA), but (2) terminated the interview before answering question q38 were classified as Break-Offs.

## Child Survey Criteria:

Cases that (1) qualified for the survey (a household in LA County that has at least one child under 18 living there(landline) or an adult with at least 1 child (cell phone)), but (2) terminated the interview before answering question c53 were classified as Break-Offs.

## LACHS Response Rate

## Adult Survey

For the Adult Survey, the combined response rates are calculated based on the percentage of interviews completed from the landline and cell phone frames. For example, $65.6 \%$ of interviews were completed in the landline frame and $34.4 \%$ of the interviews were completed in the cell frame. Therefore, the combined response rate calculations are: ( $\left.\mathrm{RR}_{\mathrm{LL}}{ }^{*} .656\right)+$ (RR $\mathrm{CP}^{*}$.344)

| LACHS Telephone Usage Weighting |  |
| :--- | :--- |
| 5,647 | Landline interviews + Partials |
| 2,990 | Cell interviews + Partials |
| 8,637 | Total |
|  |  |
| 0.65 | Landline compositing factor |
| 0.35 | Cell compositing factor |

| Dispo - Response Rates |  |  |  |
| :--- | :---: | :---: | :---: |
|  | Landline | Cell | Combined |
| RR1 | $9.62 \%$ | $6.47 \%$ | $\mathbf{8 . 5 3 \%}$ |
| RR2 | $10.35 \%$ | $7.02 \%$ | $\mathbf{9 . 2 0 \%}$ |
| RR3 | $16.97 \%$ | $11.02 \%$ | $\mathbf{1 4 . 9 1 \%}$ |
| RR4 | $18.25 \%$ | $11.95 \%$ | $\mathbf{1 6 . 0 7 \%}$ |
|  |  |  |  |
| Cooperation Rate 1 | $19.59 \%$ | $15.90 \%$ | $\mathbf{1 8 . 3 1 \%}$ |
| Cooperation Rate 2 | $21.07 \%$ | $17.24 \%$ | $\mathbf{1 9 . 7 4 \%}$ |
| Cooperation Rate 3 | $65.35 \%$ | $\mathbf{7 5 . 6 7 \%}$ | $\mathbf{6 8 . 9 2 \%}$ |
| Cooperation Rate 4 | $\mathbf{7 0 . 2 9 \%}$ | $82.03 \%$ | $\mathbf{7 4 . 3 5 \%}$ |

## Child Survey

For the Child Survey, the combined response rates are calculated as a simple weighted average, summing the proportion of interviews from each sample source by the response rate from that source.

Therefore,
Combined response rate $=\left(\right.$ RR $\left._{\text {LL }}{ }^{*} .138\right)+\left(R_{\text {LL-supp }}{ }^{*} .488\right)+\left(R_{\text {cP }}{ }^{*} .114\right)+\left(R_{\text {cP-supp }}{ }^{*} .260\right)$

## Dispo - Response Rates

Response rates for the Landline and Supplement versions are weighted by the percentage of Child interviews completed in each version.

|  | Landline | LL Supp | Cell | Cell Supp | Total |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| \# of interviews/partials | 842 | 2979 | 696 | 1589 | $\mathbf{6 1 0 6}$ |

## IX. Statistical Weighting

## Survey Weights Overview

A total of 16 population weights (i.e., weights that sum to the appropriate population total) were calculated for the Adult and Child Surveys, including:

- 1 Adult population weight
- 9 Adult subsample population weights (one for each of the 8 subsamples, and one for subsamples 3 and 5 combined)
- 1 Adult household weight
- 2 Adult subsample household weight (for subsamples 5 and 6 that were asked questions about the household)
- 1 Child population weight
- 1 Child household weight
- 1 Child population weight for children age 0-5 years in First 5 LA Best Start Communities

Population weights were developed by calculating a design weight, a compositing factor to account for the overlapping dual frame design, and then raking to population control totals. Household weights were developed by converting the population weight to an initial household weight, then raking to household-level control totals. A detailed description of the process used for each weight is provided in the following sections.

Weights that sum to the appropriate sample size were also provided, resulting in a total of 32 weight variables being produced. Weights and the related variables used in the raking process were sent to LAC-DPH in data files that contained the DATAID (qkey) for merging with final survey data.

## Raking Overview

A survey sample may cover segments of the target population in proportions that do not match the proportions of those segments in the population itself. The differences may arise, for example, from sampling fluctuations, from nonresponse, or because the sample design was not able to cover the entire target population. In such situations one can often improve the relation between the sample and the population by adjusting the sampling weights of the cases in the sample so that the marginal totals of the adjusted weights on specified characteristics, referred to as control variables, agree with the corresponding totals for the population. This operation is known as raking ratio estimation, raking, or sample-balancing, and the population totals are usually referred to as control totals.

Raking is most often used to reduce biases from nonresponse and noncoverage in sample surveys. It adjusts a set of data so that its marginal totals match control totals on a specified set of variables. The term "raking" suggests an analogy with the process of smoothing the soil in a garden plot by alternately working it back and forth with a rake in two perpendicular directions. Raking usually proceeds with one variable at a time, applying a proportional adjustment to the weights of the cases that belong to the same category of the control variable. The initial design weights in the raking process are often equal to the inverse of the selection probabilities and may have undergone some adjustments for unit
nonresponse and non-coverage. The weights from the raking process are used in estimation and analysis.

The adjustment to control totals is sometimes achieved by creating a cross-classification of the categorical control variables (e.g., age categories $\times$ gender $\times$ race $\times$ household-income categories) and then matching the total of the weights in each cell to the control total. This approach, however, can spread the sample thinly over a large number of adjustment cells. It also requires control totals for all cells of the cross-classification. Often this is not feasible (e.g., control totals may be available for age $\times$ gender $\times$ race but not when those cells are subdivided by household income). The use of raking with marginal control totals for single variables (i.e., each margin involves only one control variable) often avoids many of these difficulties.

In a simple 2-variable example the marginal totals in various categories for the two control variables are known from the entire population, but the joint distribution of the two variables is known only from a sample. In the cross-classification of the sample, arranged in rows and columns, one might begin with the rows, taking each row in turn and multiplying each entry in the row by the ratio of the population total to the weighted sample total for that category, so that the row totals of the adjusted data agree with the population totals for that variable. The weighted column totals of the adjusted data, however, may not yet agree with the population totals for the column variable. Thus, the next step, taking each column in turn, multiplies each entry in the column by the ratio of the population total to the current total for that category. The weighted column totals of the adjusted data now agree with the population totals for that variable, but the new weighted row totals may no longer match the corresponding population totals.

This process continues, alternating between the rows and the columns, and close agreement on both rows and columns is usually achieved after a small number of iterations. The result is a tabulation for the population that reflects the relation of the two control variables in the sample. Raking can also adjust a set of data to control totals on three or more variables. In such situations, the control totals often involve single variables, but they may involve two or more variables.

Ideally, one should rake on variables that exhibit an association with the key survey outcome variables and that are related to nonresponse and/or noncoverage. This strategy will reduce bias in the key outcome variables. In practice, other considerations may enter. A variable such as gender may not be strongly related to key outcome variables or to nonresponse, but raking on it may be desirable to preserve the "face validity" of the sample. For more details on raking survey data see Battaglia et al. (2009).

## Additional Variables Used in Weighting

Several variables were recoded/created by LAC-DPH for use in the weighting process.

## Race

Race was recoded for cases that completed the Adult and Child Survey. The variable was called RACE in the Adult data set and CRACE in the Child data set. Race was recoded to the following values using this hierarchy:

1=Latino (assigned if Hispanic was reported at all)
2=White (assigned if only White was reported)
3=African American (assigned if Black was reported at all)
4=NHOPI (assigned if Native Hawaiian/Pacific Islander reported at all)
5=Asian (assigned if Asian reported at all)
6=American Indian/Alaskan Native (assigned if only American Indian/Alaskan Native was reported)
8=White/American Indian (all remaining cases, which are White/American Indian)
9=Do not know/Refused

Cases with a value of 8 were randomly assigned to White or to American Indian/Alaskan Native. Cases with a value of 9 were imputed by Abt SRBI using the weighted sequential hot deck method. This is the variable I_RACE_R for adults and I_CRACE_R for children.

## Age

In the Adult data, LAC-DPH hot decked respondents who refused to report a specific age group ( $\mathrm{N}=17$ ) into one of the 7 age groups. This is the variable AGEGROUP. For the child data the variable is CAGEGROUP (and not hot decking was necessary due to the design of the Child survey).

## Education

LAC-DPH generally collapses the education question from 6 to 4 levels, so this variable with collapsed categories (EDU) was provided in the Adult data. Missing values were imputed using the weighted sequential hot deck method. This is the variable I_EDU.

## Household Members

Cleaned variables with the number of Adults (HOUADULT and CHOUADULT) and dependents (HOUDEPT and CHOUDEPT) in the household were added to both the Adult and Child data sets, respectively.

## Health District \& SPA

LAC-DPH provided a file classifying each Adult and Child interview case by Health District (GEO_HD for Adult and HD_2012 for Child)) and SPA (GEO_SPA for Adult and SPA_2012 for Child).

## First 5 LA Best Start Communities

After geocoding was completed, LAC-DPH also identified the Child Survey complete cases age 0-5 years that were in one of the 14 First 5 LA Best Start Communities, which are defined by 383 census tracts ( $n=700$ ). The variable BSC indicates in which of the 14 BSC communities the respondent lives and the variable FLAG_BSC_AGEOTO5 = 1 identifies the 700 children age 0-5 years.

## Telephone Service

This 4-category variable (TELEPHONE_SERVICE6C) was created for the Adult data and Child data:
1 = cell only
2 = landline only
3 = dual user, cell mostly
4 = dual user, not cell mostly

LAC-DPH also provided the following population control totals for use in weighting:

1. Final LAC ESTIMATES FOR LACHS 2011_update0615_Final: Contains the total 2014 population, the total adult population, and the total child population for Los Angeles County. Population figures are provided for each Health District and SPA. Control totals are provided separately for adults and children for race by gender by age within each SPA. These were ssed to calculate population weights for the Adult and Child Surveys.
2. Households and HHs with children by Health District, SPA, County Total: 2009-2013 American Community Survey count of households and households containing at least one child by SPA and Health District in Los Angeles County. These were used to calculate the Adult and Child household weights.
3. BSC ESTIMATES FOR LACHS 2012_update0615_Final: Contains the 2014 total child population within the First 5 LA Best Start Communities. Totals are provided for race/ethnicity as well as for gender. The child population in each of the 14 BSCs is also provided. These were used to calculate the Child population First 5 LA BSC weights.

## Adult Survey Weights

The weighting procedures for the 2014-15 LACHS closely followed the weighting procedures used for the 2010-2011 LACHS. The weighting methodology for the combined adult sample involved two main steps:

1) calculation of the composite weight, and
2) calculation of final weight based on raking to population control totals.

The development of the composite weight involved calculating a base sampling weight equal to the reciprocal of the selection probability of the sample telephone number (i.e., total telephone numbers in the sampling frame divided by telephone numbers released). The base sampling weight was adjusted for the random sampling of one adult from each landline telephone number household. The final aspect of the composite weights calculation involved combining dual user (landline and cell phone service) adults from the landline and cell phone samples.

Population control totals come from July 1, 2014, Population Estimated Projects (PEPs) for Los Angeles County (provided by LAC-DPH), and the 2009-2013 American Community Survey data for Los Angeles County. The raking weighting methodology included:

## County level controls for:

- marital status
- education
- number of adults in the household
- number of children in the household
- race/ethnicity
- age by gender
- nativity
- citizenship status
- tenure status
- Health District
- type of telephone service

## Controls within each SPA for:

- race/ethnicity
- gender by age

The final raked weight for use in estimation is $A D U L T \_P O P_{-} W T$. The final weight for the 8,008 completed adult interviews sums to $7,727,800$ adults residing in households in Los Angeles County. This population total comes from the July 1, 2014, PEPs. The ADULT_SAMP_WT was scaled to the sample size of 8,008 interviews.

Note: SAS weighting variables are shown in italics (e.g., ADULT_POP_WT).

## Composite Weight

## Base Sampling Weight

The sample design contains a cell phone sample divided into two strata, and a landline sample that was divided into three strata. The base sampling weight for the cell phone sample equals the population count of cell phone telephone numbers in the stratum divided by the sample size of cell phone numbers released for interviewer dialing for that stratum. For each landline stratum, the base sampling weight equals the population count of landline telephone numbers in the stratum divided by the sample size of telephone numbers released for that stratum. The base sampling weights are shown in Table 4.

Table 4. Adult Survey Base Sampling Weights

| FPROJ | NOSTRATA | Total <br> Sample Size <br> of <br> Telephone <br> Numbers | Population <br> Count of <br> Telephone <br> Numbers | BSW |
| :--- | :--- | ---: | ---: | ---: |
| 300821 | 3 | 19,624 | 181,300 | 9.238687 |
| 300821 | 4 | 169,407 | $8,068,900$ | 47.63026 |
| 300821 | 5 | 32,446 | 736,900 | 22.71158 |
| $30082 c$ | 6 | 7,672 | 463,600 | 60.42753 |

| 30082 c | 7 | 57,605 | $14,410,400$ | 250.1588 |
| :--- | :--- | ---: | ---: | ---: |

One adult was randomly sampled from each landline sample household. For the landline sample households (SURVEYFRAME = 2): BSW_NUM_ADULT = BSW times the number of adult in the household (S3 with the maximum number of adults in the household capped at 4). The cell phone was treated as a personal communication device and therefore no random selection of an adult from the household took place. For the cell phone sample (SURVEYFRAME = 1): BSW_NUM_ADULT = BSW.

Before calculating the composite weight, it was necessary to create variables related to the type of telephone service for the adult in the household. These variables are documented in Appendix III-A and Appendix III-B.

## Compositing Factors

The cell phone and landline samples cannot be simply combined because there is an overlap component that would be over-represented - dual users from the cell phone sample and dual users from the landline sample. Compositing factors allow the overlap components to be combined. Furthermore, we separated the dual users from each sample into cell mostly and not cell mostly groups. We calculated separate compositing factors ( $\lambda$ ) for the cell mostly and not cell mostly groups. For each group the two compositing factors sum to 1.0 (i.e., $\lambda+(1-\lambda)=1.0$ ).

For each of the four dual user categories (TELEPHONE_SERVICE6 $=3,4,5$, and 6 ) we calculated the coefficient of variation (CV) of BSW_NUM_ADULT. The CV was then used to calculate the design effect due to unequal weighting:

$$
\text { Deff }=1+\text { CV }^{2}
$$

The effective sample size for each of the above four categories was calculated by dividing the unweighted count of interviews in a category by the design effect for that category.

For the cell mostly overlap sample the compositing factors equal:
Category 3 COMPOSITING_FACTOR = Category 3 Effective Sample Size / Sum of Category 3 and 5 Effective sample Sizes.

Category 5 COMPOSITING_FACTOR = Category 5 Effective Sample Size / Sum of Category 3 and 5 Effective sample Sizes.

For the not cell mostly overlap sample the compositing factors equal:

Category 4 COMPOSITING_FACTOR = Category 4 Effective Sample Size / Sum of Category 4 and 6 Effective sample Sizes.

Category 6 COMPOSITING_FACTOR = Category 6 Effective Sample Size / Sum of Category 4 and 6 Effective sample Sizes.

| TELEPHONE_SERVIVE6C | Number of Interviews | COMPOSITING FACTOR |
| :--- | :---: | :---: |
| 3 (Cell mostly, dual user, <br> landline sample) | 1,090 | 0.613 |
| 4 (Not cell mostly, dual <br> user, landline sample) | 3,015 | 0.822 |
| 5 (Cell mostly, dual user, <br> cell sample) | 578 | 0.387 |
| 6 (Not cell mostly, dual <br> user, cell sample) | 600 | 0.178 |

For TELEPHONE_SERVICE6 categories 3, 4, 5, and 6:
COMPOSITE_WT = BSW_NUM_ADULT x COMPOSITING FACTOR.

For TELEPHONE_SERVICE6 categories 1 and 2, COMPOSITE_WT = BSW_NUM_ADULT.

## Raking To Population Control Totals

## Imputation for Item Nonresponse

Raking population control totals are not subject to missing data, however the corresponding survey variables may have missing values due to item nonresponse. The SAS weighted sequential hot deck procedure was therefore used to impute missing values for weighting variables before continuing the weight calculations. Before implementing the hot deck imputation 87 adults with a RACE value of 8 (white and American Indian) were imputed with equal probability to either white alone or American Indian alone. The resulting variable is $R A C E \_R$.

The following weighting variables were imputed:

- EDU (Education)
- RACE_R (Race/ethnicity)
- Q64 (Nativity)
- Q64C (Citizenship)
- Q75 (Marital status)
- Q79 (Tenure status)

The hot deck imputation cells were defined using GEO_SPA by AGEGROUP (with categories 2 and 3 combined, and categories 4, 5, 6 combined). The weighted sequential hot deck weight variable is COMPOSITE_WT. The imputed variables are identified with an "I_" in the interview data set.

## Creation of 13 Raking Variables In the Interview File

As discussed below we used raking to population control totals to create the final adult weight. An initial step in this process involved creating the initial raking variables in the interview data set.

TELEPHONE_SERVICE6C was created from TELEPHONE_SERVICE6 TELEPHONE_SERVICE6

- 1 Cell-only
- 2 Landline-only
- 3 Cell mostly, dual user, landline sample
- 4 Not cell mostly, dual user, landline sample
- 5 Cell mostly, dual user, cell sample
- 6 Not cell mostly, dual user, cell sample

GEO_HD_R

- Renumber GEO_HD from 1 to 26 because the control totals are numbered that way.

GEO_SPA_ I_RACE_R

- GEO_SPA has 8 categories and $I$ RACE_R (defined below has) 6 categories ( $8 \times 6=48$ cells).

GEO_SPA_GENDER_AGEGROUP

- GEO_SPA has 8 categories and GENDER_AGEGROUP (defined below) has 14 categories ( $8 \times 14$ $=112$ cells).

HOUDEPT_R

- 0
- 1
- 2
- 3+

HOUADULT_R

- 1
- 2
- 3
- $4+$

I_Q64_R

- 1,2 1 Born in US
- 3

2 Born Outside US

I_Q64C

- 1 U.S. citizen
- 2 not U.S. citizen

I_Q79_R
$\begin{array}{ll}\text { - } 2 & 1 \text { Own } \\ \text { - 1,3, } 4 & 2 \text { Rent }\end{array}$

I_Q75_R

- 1
- 2,3,7 2 Never married, living together, domestic partners
- 4

3 Widowed

- 5, 6

4 Divorced, separated

I_EDU

- 1 L.T. HS
- 2 HS grad
- 3 Some college
- 4 College grad

I_RACE_R

- 1 Latino
- 2 White alone, not Latino
- 3 Black alone, not Latino
- 4 Asian alone, not Latino
- 5 NHOPI alone, not Latino
- 6 American Indian alone, not Latino

```
GENDER_AGEGROUP
AGEGROUP (7 categories) by Q5 (2 categories) = 14 cells
    Agegroup q5
    - 1 1 18-24 male
    - 2 1 25-29 male
    - 3 1 30-39 male
    - 4 1 40-49 male
    - 5 1 50-59 male
    - 6 1 60-64 male
    - 7 1 65+ male
    - 1 2 18-24 female
    - 2 25-29 female
    - 3 30-39 female
    - 4 2 40-49 female
    - 5 2 50-59 female
    - }6\mathrm{ 2 60-64 female
    - 7 2 65+female
```

## Raking Implementation

The COMPOSITE_WT was raked to population control totals for 13 margins:

1) Telephone service group (TELEPHONE_SERVICE6C),
2) Health District (GEO_HD_R),
3) SPA by Race/ethnicity (GEO_SPA_I_RACE_R2),
4) SPA by gender by age (GEO_SPA_GENDER_AGEGROUP_R),
5) Number of adults in the household (HOUADULT_R),
6) Number of children in the household (HOUDEPT_R),
7) Citizenship status (I_Q64C),
8) Nativity (I_Q64_R),
9) Tenure status (I_Q79_R),
10) Marital status (I_Q75_R),
11) Education (I_EDU),
12) Race/ethnicity (I_RACE_R), and
13) Gender by age (GENDER_AGEGROUP).

The telephone service variable (TELEPHONE_SERVICE6C) used in the raking consists of four categories:

1) cell-only adult,
2) landline-only adult, and
3) landline and cell (dual user) adult - cell mostly,
4) landline and cell (dual user) adult - not cell mostly.

It was necessary to do some collapsing of small sample size categories to help avoid extreme weights. A minimum category sample size of 20 was used. Appendix III-C shows the categories that were collapsed.

The population control totals for education, marital status, number of adults in the household, number of children in the household, tenure status, nativity, and citizenship status were obtained from the 2009-2013 American Community Survey PUMS. These control totals are for adults living in households in Los Angeles County. The population control totals for Health District, race/ethnicity, gender by age, SPA by race/ethnicity, and SPA by gender by age were obtained from July 1, 2014, PEPs.

The telephone usage group population estimates for adults in Los Angeles County were constructed from the model-based estimates for Los Angeles County released by the National Center for Health Statistics (2013). The NCHS estimates are for January - December 2012. The cell phone only adult population has increased each year. We used NCHS (2015) estimates for 2012 and 2014 of the increase in cell only adults in the West Census Region to increase the percent of adults that are cell only in Los Angeles Country by a factor of 1.0823 (i.e., an 8.23 percent increase), and reduced the other three telephone service groups so that the percentages summed to $100 \%$.

| TELEPHONE_SERVICE6 | 1 | 2 | 3,5 | 4,6 |
| :--- | :--- | :--- | :--- | :--- |
| TELEPHONE_SERVICE6C | 1 | 2 | 3 | 4 |

|  | Cell-only | Landline-Only | Dual user, cell <br> mostly | Dual user, not <br> cell mostly |
| :--- | :--- | ---: | ---: | ---: |
| Los Angeles County | $34.91 \%$ | $7.41 \%$ | $22.62 \%$ | $35.06 \%$ |

The IGCV SAS raking macro (Izrael et al. 2009) was used to calculate the final weights for the combined (landline and cell phone) sample. The population control totals and weighted sample distributions prior to raking are shown in Appendix D (see Weighted Distribution Prior To Raking. Iteration 0). The raking macro was set to a maximum of 100 iterations and a convergence criterion of a maximum difference of 0.05 percentage points between a control total percent and the corresponding weighted sample percent.

The IGCV raking macro used weight trimming during the raking iteration to help avoid extreme weights. The raking used the four trimming parameters shown below.

| IGCV weight trimming values: |  |
| :--- | :--- |
|  |  |
| A $=5.0$ | $/ *$ weight will be decreased to individual weight times A */ |
| B $=0.20$ | $/^{*}$ weight will be increased to individual weight times B */ |
| $C=10.0$ | $/^{*}$ weight will be decreased to mean weight times C */ |
| $D=0.10$ | $/^{*}$ weight will be increased to mean weight times D */ |

The raking output is shown in Appendix D (see Weighted Distribution After Raking). The final raked weight for use in estimation is ADULT_POP_WT. The final weight for the 8,008 completed adult interviews sums to $\mathbf{7 , 7 2 7 , 8 0 0}$ adults residing in households in Los Angeles County. This population total comes from the July 1, 2014 PEPs. The $A D U L T \_S A M P \_W T$ was scaled to the sample size of 8,008 interviews.

## 2014-15 LACHS Adult Subsamples

The LACHS administered questionnaire modules to eight random subsamples of the adult sample.

| Subsample (SUBSAMP) | Number of Interviews |
| :---: | :---: |
| 1 | 1002 |
| 2 | 999 |
| 3 | 1000 |
| 4 | 996 |
| 5 | 998 |
| 6 | 1003 |
| 7 | 997 |
| 8 | 1013 |

Population weights were developed for each of the eight subsamples and subsamples 3 and 5 combined:

```
ADULT_POP_WT_SBSMP_1
ADULT_POP_WT_SBSMP_2
ADULT_POP_WT_SBSMP_3
ADULT_POP_WT_SBSMP_4
ADULT_POP_WT_SBSMP_5
ADULT_POP_WT_SBSMP_6
ADULT_POP_WT_SBSMP_7
ADULT_POP_WT_SBSMP_8
ADULT_POP_WT_SBSMP_35
```

Sample weights were also developed:

```
ADULT_SAMP_WT_SBSMP_1
ADULT_SAMP_WT_SBSMP_2
ADULT_SAMP_WT_SBSMP_3
ADULT_SAMP_WT_SBSMP_4
ADULT_SAMP_WT_SBSMP_5
ADULT_SAMP_WT_SBSMP_6
ADULT_SAMP_WT_SBSMP_7
ADULT_SAMP_WT_SBSMP_8
ADULT_SAMP_WT_SBSMP_35
```

Each adult in a subsample already has a COMPOSITE_WT calculated from the adult sample weighting. This weight was used as the raking input weight for each subsample.

A key aspect of the raking of each sample was a determination of the collapsing of small sample size categories. We implemented the cell collapsing by first examining the sample sizes by subsample for each raking variable (see Appendix III-E). We felt that using one set of cell collapsing rules for all subsamples would allow for the consistent weighting of each subsample. Appendix III-F shows the collapsed categories used in all of the subsamples.

The IGCV SAS raking macro (Izrael et al. 2009) was used calculate the final weights for each of the eight subsamples. The population control totals and weighted distributions prior to raking for the first subsample are shown in Appendix III-G (see Weighted Distribution Prior To Raking. Iteration 0). The raking macro was set to a maximum of 100 iterations and a convergence criterion of a maximum difference of 0.1 percentage points between a control total percent and the corresponding weighted sample percent.

The IGCV raking macro used weight trimming during the raking iteration to help avoid extreme weights. The raking used the four trimming parameters shown below.

| IGCV weight trimming values: |  |
| :--- | :--- |
|  | $/^{*}$ weight will be decreased to individual weight times A */ |
| A $=5.0$ | $/^{*}$ weight will be increased to individual weight times B */ |
| B $=0.20$ |  |

| $\mathrm{C}=10.0$ | /* weight will be decreased to mean weight times C */ |
| :--- | :--- |
| $\mathrm{D}=0.10$ | /* weight will be increased to mean weight times D */ $^{2}$ |

The raking output for the first subsample is shown in Appendix III-G (see Weighted Distribution After Raking). The raking results for the other subsamples are very similar to the first subsample raking.

## Child Survey Weights

The weighting methodology for the combined Child sample involved two main steps:

1) calculation of the composite weight, and
2) calculation of final weight based on raking to population control totals.

The weighting procedures for the 2014-15 survey closely followed the weighting procedures used for the 2010-2011 survey. The development of the composite weight involved calculating a base sampling weight equal to the reciprocal of the selection probability of the sample telephone number (i.e., total telephone numbers in the sampling frame divided by telephone numbers released). The base sampling weight was adjusted for the number of adult cell phone telephone numbers associated with the household, and for the random sampling of a child from each household. The final aspect of the composite weights calculation involved combining dual user (landline and cell phone service) households from the landline and cell phone samples.

Population control totals come from 2014 PEPs and the 2009-2013 American Community Survey PUMS data for Los Angeles County. The raking weighting methodology included:

## County level controls for:

- number of adults in the household
- number of children in the household
- race/ethnicity of the child
- age by gender of the child
- nativity of the child
- Health District
- type of telephone service

## Controls within each SPA for:

- race/ethnicity of the child
- gender by age of the child

The final raked weight for use in estimation is $C H I L D_{-} P O P_{-} W T$. The final weight for the 5,982 completed child interviews sums to $2,341,236$ children in Los Angeles County. This population total comes from 2014 PEPs. The CHILD_SAMP_WT was scaled to the sample size of 5,982 child interviews.

Note: SAS weighting variables are shown in italics (e.g., CHILD_POP_WT).

## Composite Weight

## Base Sampling Weight

As discussed above the sample design contains three cell phone samples ( $F P R O J=30082 \mathrm{c}, 30082 \mathrm{sc}$, and 30082 tc ). All three cell phone samples were stratified. There are also three landline samples (FPROJ = 30082l, 30082sc, and 30082tc). All three landline samples were also stratified. The preliminary base sampling weight (CHILD_BSW_PRELIM) for each cell phone sample equals the population count of cell phone telephone numbers in a stratum divided by the sample size of cell phone numbers in that stratum released for interviewer dialing. Because three cell phone samples were drawn, the base sampling weights were divided by three to from the final base sampling weight (CHILD_BSW). The preliminary base sampling weight (CHILD_BSW_PRELIM) for each landline sample equals the population count of landline phone telephone numbers in a stratum divided by the sample size of landline phone numbers in that stratum released for interviewer dialing. Because three landline samples were drawn, the base sampling weights were divided by three to from the final base sampling weight (CHILD_BSW).

Table 5. Child Survey Base Sampling Weights

| FPROJ | NOSTRATA | Total <br> Sample Size <br> of <br> Telephone <br> Numbers | Population <br> Count of <br> Telephone <br> Numbers | CHILD_BSW_PRELIM | CHILD_BSW |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 30082c | 6 | 7672 | 463600 | 60.4275 | 20.1425 |
| 30082 c | 7 | 57605 | 14410400 | 250.1588 | 83.3863 |
| 30082 l | 3 | 19624 | 181300 | 9.2387 | 3.0796 |
| 30082 l | 4 | 169407 | 8068900 | 47.6303 | 15.8768 |
| 30082 l | 5 | 32446 | 736900 | 22.7116 | 7.5705 |
| 30082sc | 6 | 834 | 463600 | 555.8753 | 185.2918 |
| 30082 sc | 7 | 24154 | 14410400 | 596.6051 | 198.8684 |

As discussed above, the child sample involved determining whether the household contained one or more age-eligible children. This means that a child living in a cell phone household containing three adult working cell phones had a higher probability of selection than a child living in a cell phone household with one adult working cell phone. To adjust for the unequal probabilities of selection we divided the base sampling weight by the number of adult cell phone in the household ${ }^{14}$ :

If I_c78b_cleaned > 0, CHILD_NUM_CELL = CHILD_BSW / I_c78b_cleaned.
Else, CHILD_NUM_CELL = CHILD_BSW.
It was necessary to impute 46 children with a DK or REFUSED value on c78b_cleaned and 222 children for whom question c78b was not asked. The imputation of these 268 children with missing values was implemented using a SAS weighted sequential hot deck macro. The hot deck imputation cells were formed using SURVEYFRAME and C78.

One child was randomly sampled from each sample household. For most household one child age 017 years was randomly selected. For a portion of the sample located in ZIP codes overlapping with BSC areas (BSC_Mike =1) a child age 0-5 was randomly selected even if the household also contained children age $6-17$ years. This oversampling of children age $0-5$ was implemented to help ensure that the overall target of BSC interviews for children age 0-5 years was met. This oversampling was accounted for in this weighting step using the following steps:

If BSC_Mike equals ( 0,8 or 9), CHILD_NUM_PRELIM_WT $=$ CHILD_NUM_CELL $x$ totchild_r, where totchild values greater than 4 were recoded to 4.

If BSC_Mike $=1$ and sc2_3>0,CHILD_NUM_PRELIM_WT $=$ CHILD_NUM_CELL x sc2_3_r, where sc2_3 values greater than 3 were recoded to 3 .

If BSC_Mike $=1$ and sc2_3 $=0$, CHILD_NUM_PRELIM_WT $=$ CHILD_NUM_CELL x (sc2_1_r $\left.+\mathrm{sc} 2 \_2 \_r\right)$, where sc2_1 values greater than 3 were recoded to 3, and sc2_2 values greater than 3 were be recoded to 3.

[^10]We then used the age distribution of sample children in BSC ZIP codes prior to the oversampling of children age 0-5 years (BSC_Mike $=9$ ) to adjust the age distribution of sample children in BSC ZIP codes after the oversampling of children age 0-5 years was implemented (BSC_Mike = 1).

If BSC_Mike $=1$ and CAGEGROUP $=1$ CHILD_NUM_WT $=$ CHILD_NUM_PRELIM_WT $\times 0.7258$.
If BSC_Mike $=1$ and CAGEGROUP $=2$ CHILD_NUM_WT $=$ CHILD_NUM_PRELIM_WT $\times 1.8222$.
If BSC_Mike $=1$ and CAGEGROUP $=3$ CHILD_NUM_WT $=$ CHILD_NUM_PRELIM_WT $\times 0.7337$.
Else, CHILD_NUM_WT = CHILD_NUM_PRELIM_WT.

## Compositing Factors

The cell phone and landline samples cannot be simply combined because there is an overlap component that would be over-represented - dual users from the cell phone sample and dual users from the landline sample. Compositing factors allow the overlap components to be combined. Furthermore, we separated the dual users from each sample into cell mostly and not cell mostly groups. We calculated separate compositing factors $(\lambda)$ for the cell mostly and not cell mostly groups. For each group the two compositing factors sum to 1.0 (i.e., $\lambda+(1-\lambda)=1.0$ ).

For each of the four dual user categories (TELEPHONE_SERVICE6 $=3,4,5$, and 6 ) we calculated the coefficient of variation (CV) of CHILD_NUM_WT. The CV was then used to calculate the design effect due to unequal weighting:

Deff $=1+$ CV $^{2}$.
The effective sample size for each of the above four categories was calculated by dividing the unweighted count of interviews in a category by the design effect for that category.

For the cell mostly overlap sample the compositing factors equal:
Category 3 Compositing Factor = Category 3 Effective Sample Size / Sum of Category 3 and 5 Effective sample Sizes.

Category 5 Compositing Factor = Category 5 Effective Sample Size / Sum of Category 3 and 5 Effective sample Sizes.

For the not cell mostly overlap sample the compositing factors equal:
Category 4 Compositing Factor = Category 4 Effective Sample Size / Sum of Category 4 and 6 Effective sample Sizes.

Category 6 Compositing Factor = Category 6 Effective Sample Size / Sum of Category 4 and 6 Effective sample Sizes.

| TELEPHONE_SERVIVE6C | Number of Interviews | Compositing Factor |
| :--- | :--- | :--- |
| 3 (Cell mostly, dual user, <br> landline sample) | 1,227 | 0.654 |
| 4 (Not cell mostly, dual <br> user, landline sample) | 2,159 | 0.839 |
| 5 (Cell mostly, dual user, <br> cell sample) | 488 | 0.346 |
| 6 (Not cell mostly, dual <br> user, cell sample) | 395 | 0.161 |

For TELEPHONE_SERVICE6 categories 3, 4, 5, and 6:

CHILD_COMPOSITE_WT = CHILD_NUM_WT x Compositing Factor.
For TELEPHONE_SERVICE6 categories 1 and 2, CHILD_COMPOSITE_WT = CHILD_NUM_WT.

## Raking To Population Control Totals

## Imputation for Item Nonresponse

Raking population control totals are typically not subject to missing data, however the corresponding survey variables may have missing values due to item nonresponse. The SAS weighted sequential hot deck macro procedure was therefore used to impute missing values for weighting variables before continuing the weight calculations. Before implementing the hot deck imputation 25 children with a CRACE value of 8 (white and American Indian) were imputed with equal probability to either white alone or American Indian alone. The resulting variable is CRACE_R. The following weighting variables were then imputed:

- CRACE_R (Race/ethnicity)
- C65_R (Nativity)

The hot deck imputation cells were defined using SPA_2012 by CAGEGROUP (0-5, 6-11, 12-17 years). The weighted sequential hot deck weight variable is CHILD_COMPOSITE_WT. The imputed variables are identified with an "I_" in the interview data set.

## Creation of 9 Raking Variables In the Interview File

As discussed below we used raking to population control totals to create the final Child weight. An initial step in this process involved creating the raking variables in the interview data set.

TELEPHONE_SERVICE6C was created from TELEPHONE_SERVICE6
TELEPHONE_SERVICE6

- 1 Cell-only
- 2 Landline-only
- 3 Cell mostly, dual user, landline sample
- 4 Not cell mostly, dual user, landline sample
- 5 Cell mostly, dual user, cell sample
- 6 Not cell mostly, dual user, cell sample

HD_2012_R

- HD_2012 renumbered from 1 to 26 because the control totals are numbered that way.

SPA_2012_ I_CRACE_R

- SPA_2012 has 8 categories and $I$ CRACE_R defined below has 6 categories ( $8 \times 6=48$ cells).

SPA_2012_GENDER_CAGEGROUP

- SPA_2012 has 8 categories and GENDER_CAGEGROUP defined below has 6 categories ( $8 \times 6=$ 48 cells).

## CHOUDEPT_R

- 1
- 2
- 3
- 4
- $5+$

CHOUADULT_R

- 1
- 2
- 3
- 4
- $5+$

I_C65_R

- 1,2 1 Born in US
- 3

2 Born Outside US

I_CRACE_R

- 1 Latino
- 2 White nonHispanic
- 3 Black nonHispanic
- 4 Asian nonHispanic
- 5 NHOPI nonHispanic
- 6 American Indian nonHispanic

## GENDER_CAGEGROUP

C3 (2 categories) by CAGEGROUP (3 categories) $=6$ cells
C3 CAGEGROUP

- $1 \quad 1 \quad$ 12-17 male
- 1 2 6-11 male
- 1 0-5 male
- 2 1 12-17 female
- 2 2 6-11 female
- 2 3 0-5 female

## Raking Implementation

The CHILD_COMPOSITE_WT was raked to population control totals for 9 margins:

1) Telephone service group (TELEPHONE_SERVICE6C),
2) SPA by Race/ethnicity (SPA_2012_ __CRACE_R2),
3) SPA by gender by age (SPA_2012_GENDER_CAGEGROUP),
4) Health District (HD_2012_R),
5) Number of children in the household (CHOUDEPT_R),
6) Number of adults in the household (CHOUADULT_R),
7) Nativity (I_C65_R),
8) Race/ethnicity (I_CRACE_R), and
9) Gender by age (GENDER_CAGEGROUP).

The telephone service variable (TELEPHONE_SERVICE6C) used in the raking consists of four categories:

1) cell-only,
2) landline-only,
3) dual user - cell mostly, and
4) dual user - not cell mostly.

It was necessary to do a limited amount of collapsing of small sample size categories for the other raking variables to help avoid extreme weights. A minimum category sample size of 20 was used, except for race/ethnicity where the NHOPI sample size is 18, in order to separately represent all 6 race/ethnicity groups. Appendix III-J shows each raking variable and the categories that were collapsed.

The population control totals for number of adults in the household, number of children in the household, tenure status, and nativity were obtained from the 2009-2013 American Community Survey PUMS. These control totals are for children living in households in Los Angeles County. The
population control totals for Health District, race/ethnicity, gender by age, SPA by race/ethnicity, and SPA by gender by age were obtained from 2014 PEPs.

The telephone usage group population estimates for children in Los Angeles County were constructed from the model-based estimates for Los Angeles County released by the National Center for Health Statistics (2013). The NCHS estimates are for January - December 2012. The percent of children living in cell phone only households has increased over time. We used NCHS (2015) annual cell-only estimates for the West Census Region to increase the percent of children that live in cell-only households in Los Angeles County by a factor of 1.131 (i.e., an 13.1 percent increase), and reduced the other three telephone service groups so that the percents summed to $100 \%$.

| TELEPHONE_SERVICE6_CHILD | 1 | 2 | 3,5 | 4,6 |
| :--- | :--- | :--- | :--- | :--- |
| TELEPHONE_SERVICE6C_CHILD | 1 | 2 | 3 | 4 |
|  | Cell-only | Landline-Only | Dual user, cell <br> mostly | Dual user, not <br> cell mostly |
| Los Angeles County | $42.22 \%$ | $6.10 \%$ | $22.89 \%$ | $28.80 \%$ |

The IGCV SAS raking macro (Izrael et al. 2009) was used calculate the final weights for the combined (landline and cell phone) sample. The population control totals and weighted sample distributions prior to raking are shown in Appendix III-K (see Weighted Distribution Prior To Raking. Iteration 0). The raking macro was set to a maximum of 100 iterations and a convergence criterion of a maximum difference of 0.05 percentage points between a control total percent and the corresponding weighted sample percent.

The IGCV raking macro used weight trimming during the raking iteration to help avoid extreme weights. The raking used the four trimming parameters shown below.

| IGCV weight trimming values: |  |
| :--- | :--- |
|  | $/^{*}$ weight will be decreased to individual weight times A */ |
| $A=6.0$ | $/^{*}$ weight will be increased to individual weight times B */ |
| $B=0.167$ | $/^{*}$ weight will be decreased to mean weight times C */ |
| $C=11.0$ | $/^{*}$ weight will be increased to mean weight times $D^{*} /$ |
| $D=0.091$ |  |

The raking output is shown in Appendix III-K (see Weighted Distribution After Raking). The final raked weight for use in estimation is CHILD_POP_WT. The final weight for the 5,982 completed child interviews sums to $\mathbf{2 , 3 4 1 , 2 3 6}$ children in Los Angeles County. This population total comes from 2014 population estimates. The CHILD_SAMP_WT was scaled to the sample size of 5,982 child interviews.

## Adult Household Weights

The weighting methodology for the combined adult sample involved two main steps:

1) Conversion of the final adult population weight to an initial household weight, and
2) Calculation of final household weight based on raking to household control totals for Los Angeles County.

The weighting procedures for the 2014-2015 LACHS closely followed the weighting procedures used for the 2010-2011 LACHS. The development of the initial household weight involved dividing the final adult population weight by the number of adults in the household at the point of respondent selection. Because cell phone-only and dual user (landline and cell phone service) households with multiple adult cell phones had a greater chance of being sampled than a cell-only or dual user household with one adult cell phone, we divided the initial household weight for those households by the number of adult cell phones in the household. Details of the calculation of the adult population weights are outlined in the Adult Weights section.

The household control totals come from 2009-2013 American Community Survey data for Los Angeles County. The raking weighting methodology included:

## County level household-level controls for:

- number of adults in the household
- number of children in the household
- tenure status
- Health District
- SPA
- type of telephone service

The final raked weight for use in estimation is ADULT_HH_POP_WT. The final weight for the 8,008 completed interviews sums to 3,269,112 households in Los Angeles County. This household total comes from the 2014 American Community Survey. The ADULT_HH_SAMP_WT was scaled to the sample size of 8,008 interviews.

Note: SAS weighting variables are shown in italics (e.g., ADULT_HH_POP_WT).

## Initial Household Weight

The calculation of the final adult population weight ( $A D U L T_{-} P O P_{-} W T$ ) involved extensive poststratification to population control totals to adjust for differential nonresponse:

## County level controls for:

- marital status
- education
- number of adults in the household
- number of children in the household
- race/ethnicity
- age by gender
- nativity
- citizenship status
- tenure status
- Health District
- type of telephone service

## Controls within each SPA for:

- race/ethnicity
- gender by age

The adult questionnaire contains a limited set of household level variables that can be used in poststratification. To maintain the adult sample adjustment for differential nonresponse in the final household weights we divided ADULT_POP_WT of the landline sample adults by the number of adults in the household at the point of adult respondent selection ( $S 3$ with the maximum number of adults in the household capped at 4). Dividing the adult population weight by the number of adults in the household yields an initial household weight ( $H H_{-} W T_{-} 1$ ) because we are removing the withinhousehold stage in the sample design. This step was not necessary for the cell phone sample because the cell phone was treated as a personal communication device.

A cell phone-only household containing two or more adult working cell phones had a higher probability of selection than a cell phone-only household with one adult working cell phone. Furthermore, for dual user households (landline and cell phone service) a household with a landline phone and multiple adult working cell phones had a higher probability of selection than a dual user household with a landline phone and one adult working cell phone. To adjust for the unequal probabilities of selection we divided HH_WT_1 by the number of adult cell phone in the household (Q71B_R).

## Raking To Population Control Totals

The initial household weight (HH_WT_2) was raked to population control totals for six margins:

1) Telephone service group (TELEPHONE_SERVICE6C),
2) Number of adults in the household (HOUADULT_R),
3) Number of children in the household (HOUDEPT_R),
4) Tenure status (I_Q79_R),
5) Health District (GEO_HD_R), and
6) SPA (GEO_SPA).

The control totals for the number of adults in the household, number of children in the household, and tenure status were obtained from the 2009-2013 American Community Survey PUMS. These control totals are for households in Los Angeles County. The control totals for households by Health District and SPA were obtained from 2009-2013 American Community Survey tabulations. No category collapsing due to cell samples sizes less than 20 interviews was required.

The telephone service variable (TELEPHONE_SERVICE6C) used in the raking consists of four categories:

1) cell-only,
2) landline-only,
3) dual user - cell mostly, and
4) dual user - not cell mostly.

The National Center for Health Statistics does not publish telephone usage estimates for households in Los Angeles County. The telephone usage group household estimates for Los Angeles County therefore relied on the estimates for adults shown below.

| TELEPHONE_SERVICE6C | 1 | 2 | 3 | 4 |
| :--- | :--- | :--- | :--- | :--- |
|  | Cell-only | Landline- <br> Only | Dual user, <br> cell mostly | Dual user, <br> not cell <br> mostly |
| Los Angeles County | $34.910 \%$ | $7.41 \%$ | $22.62 \%$ | $35.06 \%$ |

The IGCV SAS raking macro (Izrael et al. 2009) was used calculate the final weights for the combined (landline and cell phone) sample. The household control totals and weighted sample distributions prior to raking are shown in Appendix III-L (see Weighted Distribution Prior To Raking. Iteration 0). The raking macro was set to a maximum of 100 iterations and a convergence criterion of a maximum difference of 0.05 percentage points between a control total percent and the corresponding weighted sample percent.

The IGCV raking macro used weight trimming during the raking iteration to help avoid extreme weights. The raking used the four trimming parameters shown below.

| IGCV weight trimming values: |  |
| :--- | :--- |
|  |  |
| A $=5.0$ | $/^{*}$ weight will be decreased to individual weight times A */ |
| B $=0.20$ | / $^{*}$ weight will be increased to individual weight times B */ |
| $C=10.0$ | $/^{*}$ weight will be decreased to mean weight times C */ |
| $D=0.10$ | $/^{*}$ weight will be increased to mean weight times D */ |

The raking output is shown in Appendix III-L (see Weighted Distribution After Raking). The final raked weight for use in estimation is $A D U L T \_H H \_P O P \_W T$. The final weight for the 8,008 completed interviews sums to $\mathbf{3 , 2 6 9}, \mathbf{1 1 2}$ households in Los Angeles County. The ADULT_HH_SAMP_WT was scaled to the sample size of 8,008 interviews.

## Household Weights for Subsamples 5 and 6 Combined

Subsamples (SBSMP) 5 and 6 also included household questions and household weights were therefore calculated for these two subsamples combined. The sample size for these two subsamples
combined is 2,001 (SBSMP_56 = 1 identifies adults in the two subsamples). Each household already had an initial household weight (HH_WT_2) and this was used as the raking input weight.

The IGCV SAS raking macro (Izrael et al. 2009) was used calculate the final weights for the combined (landline and cell phone) sample. The household control totals and weighted sample distributions prior to raking are shown in Appendix III-M (see Weighted Distribution Prior To Raking. Iteration 0). The raking macro was set to a maximum of 100 iterations and a convergence criterion of a maximum difference of 0.05 percentage points between a control total percent and the corresponding weighted sample percent.

The IGCV raking macro used weight trimming during the raking iteration to help avoid extreme weights. The raking used the four trimming parameters shown below.

| IGCV weight trimming values: |  |
| :--- | :--- |
|  |  |
| $A=5.0$ | $/^{*}$ weight will be decreased to individual weight times A */ |
| $B=0.20$ | $/^{*}$ weight will be increased to individual weight times B */ |
| $C=10.0$ | $/^{*}$ weight will be decreased to mean weight times C */ |
| $D=0.10$ | $/^{*}$ weight will be increased to mean weight times D */ |

The raking output is shown in Appendix III-M (see Weighted Distribution After Raking).

The household population weight is ADULT_HH_POP_WT_SBSMP_56. It sums to 3,269,112 households in Los Angeles County. The household sample weight is ADULT_HH_SAMP_WT_SBSMP_56. It sums to 2,001 interviews.

## Child Household Weights

The weighting methodology for the combined landline and cell phones child sample involved two main steps:

1) conversion of the final child population weight to an initial household weight, and 2) calculation of final household weight based on raking to household control totals for Los Angeles County.

The weighting procedures for the 2014-2015 LACHS closely followed the weighting procedures used for the 2010-2011 LACHS. The development of the initial household weight involved dividing the final child population weight by the number of age-eligible children in the household at the point of the random selection of the child from the household. Details of the calculation of the adult population weights are outlined in the Child Weights section.

The household control totals come from 2009-2013 American Community Survey data for Los Angeles County. The household raking weighting methodology included:

## County level household-level controls for:

- number of adults in the household
- number of children in the household
- Health District
- SPA
- type of telephone service

The final raked weight for use in estimation is CHILD_HH_POP_WT. The final weight for the 5,982 completed child interviews sums to $1,133,259$ households with children in Los Angeles County. This household total comes from the recently released 2014 American Community Survey. The CHILD_HH_SAMP_WT was scaled to the sample size of 5,982 child interviews.

Note: SAS weighting variables are shown in italics (e.g., CHILD_HH_POP_WT).

## Initial Household Weight

The calculation of the final child population weight (CHILD_POP_WT) involved extensive poststratification to population control totals to adjust for differential nonresponse and non-coverage (?):

## County level controls for:

- number of adults in the household
- number of children in the household
- race/ethnicity of child
- gender by age of child
- nativity of child
- Health District
- type of telephone service

## Controls within each SPA for:

- race/ethnicity of child
- gender by age of child

The child questionnaire contains a limited number of household level variables that can be used in poststratification. To maintain the child sample adjustment for differential nonresponse in the final household weights we divided CHILD_POP_WT by the number of age-eligible children in the household at the point of random selection of the child from the household. Dividing a child population weight by the number of age-eligible children in the household at the point of respondent selection yields an initial household weight (CHILD_HH_WT_1) because we are removing the withinhousehold stage of the sample design. Cell-only and dual user (landline and cell phone service) child households with multiple adult cell phones had a higher probability of selection than cell-only and dual user child households with one adult cell phone. However, this adjustment was already incorporated into the child population weight calculations so it was not necessary to implement it for the household weights.

The initial household weight (CHILD_HH_WT_1) was raked to population control totals for five margins:
14) Telephone service group (TELEPHONE_SERVICE6C),
15) Number of children in the household (CHOUDEPT_R),
16) Number of adults in the household (CHOUADULT_R),
17) Health District (HD_2012_R), and
18) SPA (SPA_2012).

The control totals for the number of children in the household, and number of adults in the household were obtained from the 2009-2013 American Community Survey PUMS. The control totals for households with children by Health District and SPA were obtained from the 2009-2013 American Community Survey tabulations.

The telephone service variable (TELEPHONE_SERVICE6C) used in the raking consists of four categories:

1) cell-only,
2) landline-only,
3) dual user - cell mostly, and
4) dual user - not cell mostly.

The National Center for Health Statistics does not publish telephone usage estimates for households with children in Los Angeles County. The telephone usage group household estimates for Los Angeles County therefore relied on the estimates for children shown below.

|  | Cell-only | Landline- <br> Only | Dual user, <br> cell mostly | Dual user, <br> not cell <br> mostly |
| :--- | :--- | :--- | :--- | :--- |
| Los Angeles County | $42.22 \%$ | $6.10 \%$ | $22.89 \%$ | $28.80 \%$ |

All of the control totals were scaled to sum to $1,133,259$ households which is the 2014 American Community Survey estimate of the number of households (i.e., occupied housing units) in Los Angeles County.

The IGCV SAS raking macro (Izrael et al. 2009) was used calculate the final weights for the combined landline and cell phone sample. The household control totals and weighted sample distributions prior to raking are shown in Appendix III-N (see Weighted Distribution Prior To Raking. Iteration 0 ). The raking macro was set to a maximum of 100 iterations and a convergence criterion of a maximum difference of 0.05 percentage points between a control total percent and the corresponding weighted sample percent.

The IGCV raking macro used weight trimming during the raking iteration to help avoid extreme weights. The raking used the four trimming parameters shown below.

| IGCV weight trimming values: |  |
| :--- | :--- |
|  |  |
| $A=6.0$ | $/^{*}$ weight will be decreased to individual weight times A */ |
| B $=0.167$ | $/^{*}$ weight will be increased to individual weight times B */ |
| $C=11.0$ | / $^{*}$ weight will be decreased to mean weight times C */ |
| $D=0.091$ | / $^{*}$ weight will be increased to mean weight times D */ |

The raking output is shown in Appendix III-N (see Weighted Distribution After Raking). The final raked weight for use in estimation is CHILD_HH_POP_WT. The final weight for the 5,982 completed child interviews sums to $1,133,259$ households with children in Los Angeles County. The CHILD_HH_SAMP_WT was scaled to the sample size of 5,982 child interviews.

## First 5 LA Best Start Community Weights

There are 14 non-contiguous First 5 LA Best Start Communities (BSC) within LA County, defined by a total of 383 census tracts. First 5 LA has programs and initiatives targeting children up to age 5 in the Best Start Communities. A total of 700 interviews were conducted in these Best Start Communities about children in this target age range of 0 to 5 . These interviews were a subset of all Child Survey interviews conducted; households in the Best Start Communities were not oversampled in any way.

The 2014-2015 BSC weighting procedures closely followed the BSC weighting procedures used for the 2010-2011 survey. The BSC target population is children age 0-5 years in the 14 BSC communities in Los Angeles County. For the population of children age 0-5 years, 2014 population estimates provides the count of children by gender, race/ethnicity, and BSC community. The 2009-2013 ACS Public Use Microdata Sample (PUMS) does not include Census tract identifiers and therefore additional control totals cannot be obtained from the ACS PUMS. We examined the 2009-2013 ACS published tables on census.gov and no additional population control total tables are available for children age $0-5$ years in the 14 BSC communities. Also, the National Center for Health Statistics does not have estimates for the percent of children age 0-5 years in the BSC communities residing in cell phone-only households. Thus, no control totals are available for the BSC communities beyond what is available in the 2014 PEPs?. The LACHS Child Survey was however weighted using control totals for:

## County level controls for:

- number of adults in the household
- number of children in the household
- race/ethnicity of the child
- age by gender of the child
- nativity of the child
- Health District
- type of telephone service

## Controls within each SPA for:

- race/ethnicity of the child
- gender by age of the child

We therefore used the final LACHS child population weight as the input weight into the raking that we conducted for the BSC Child population. This approach carries the extensive LACHS child survey poststratification to population control totals forward into the weighting of the subset of 700 children age $0-5$ years in the BSC Communities.

The final raked weight for use in estimation is BSC_CHILD_POP_WT. The final weight for the 700 BSC completed child interviews (FLAG_BSC_AGEOTO5 = 1) sums to 158,192 children age 0-5 years residing in the 14 BSC communities in Los Angeles County. This population total comes from 2014 population estimates. The BSC_CHILD_SAMP_WT was scaled to the sample size of 700 child interviews.

Note: SAS weighting variables are shown in italics (e.g., CHILD_BSC_POP_WT).

## Raking To Population Control Totals

The CHILD_POP_WT was raked to population control totals for three margins:

1) Gender (GENDER),
2) Race/ethnicity (I_CRACE_R3): Asian, NHOPI, /American Indian were combined, and
3) BSC community (_BSC_R): Broadway/Manchester and Central Long Beach were combined; West Athens and Wilmington were combined.

The category collapsing for race/ethnicity and BSC community was used to avoid categories with very small sample sizes.

The population control totals for the three raking variables were obtained from 2014 population estimates.

The IGCV SAS raking macro (Izrael et al. 2009) was used calculate the final weights for the combined (landline and cell phone) sample. The population control totals and weighted sample distributions prior to raking are shown in Appendix III-O (see Weighted Distribution Prior To Raking. Iteration 0). The raking macro was set to a maximum of 100 iterations and a convergence criterion of a maximum difference of 0.05 percentage points between a control total percent and the corresponding weighted sample percent.

The IGCV raking macro used weight trimming during the raking iteration to help avoid extreme weights. The raking used the four trimming parameters shown below.

| IGCV weigh | ming values: |
| :---: | :---: |
| A $=6.0$ | /* weight will be decreased to individual weight times A */ |
| $B=0.167$ | /* weight will be increased to individual weight times B */ |
| $\mathrm{C}=11.0$ | /* weight will be decreased to mean weight times C */ |
| $\mathrm{D}=0.091$ | /* weight will be increased to mean weight times D */ |

The raking output is shown in Appendix III-O (see Weighted Distribution After Raking).
The final raked weight for use in estimation is BSC_CHILD_POP_WT. The final weight for the 700 BSC completed child interviews (FLAG_BSC_AGEOTO5 =1) sums to 158,192 children age 0-5 years residing in the 14 BSC communities in Los Angeles County. The BSC_CHILD_SAMP_WT was scaled to the sample size of $\mathbf{7 0 0}$ child interviews.

## Appendix II-A: Answers to Frequently Asked Questions

## 30082 - 2014-15 Los Angeles County Health Survey (LACHS)

## Purpose/Topic of the Survey

Q: What is this survey about? Is this survey for real?
A: This is a very important survey conducted by the Los Angeles County Department of Public Health. It helps the LA County Health Department learn about health care needs in our city and in your neighborhood. Your participation may help improve the health and health care of county residents. The information gathered through this survey is also used to determine how tax dollars will be spent.

## Q: How are you going to use this information?

A: The Department of Health uses the data to target new and ongoing problems and to improve services in all of LA County and your neighborhood. The information gathered through this survey is also used to determine how tax dollars will be spent.

## Q: What specifically will you ask?

A: About your current health and other issues such as: how much you exercise, diseases a doctor may have told you about, and your access to health care. You can always choose not to answer a specific question, and your answers are confidential.

## Q: (Demographic/Classification) What do these questions have to do with a health survey?

A: Questions about personal and household characteristics are an important part of all surveys. Los Angeles County is one of the most diverse counties in the United States. The Department of Public Health is dedicated to understanding and meeting the needs of all County residents. These questions allow individuals to be grouped with others in similar age, race, ethnicity, or income categories in order to better understand the health practices and needs of the County's population. (If necessary, you may refer them to the County Department of Public Health at 213-240-7785.)

## Legitimacy

Q: Who is doing this survey? You are not the Department of Health?
A: I work for a research firm called Abt SRBI. Abt SRBI is conducting the telephone interviews on behalf of the LA County Department of Health.

Q: How do I know you are who you say you are?
A: I am a trained interviewer hired for this study. I can give you the name and the telephone number of my supervisor if you would like further verification.

SUPERVISOR NAME:
PHONE:

ONLY if the respondent will not accept your supervisor's number for verification: If you have any questions about the survey, you may contact the Los Angeles County Department of Public Health at 213-240-7785

## Why me?

Q: Why can't you just call someone else?
A: This survey is based on a randomly selected group of telephone numbers in LA County.
Since the telephone numbers are picked by chance, we can't substitute households or individuals.
In other words, you cannot be replaced. In addition, your participation ensures that your neighborhood is represented.

Q: Well, I'm in good health. Talk to someone else.
A: I'm glad your health is good! To have an accurate picture of the health of County residents, we need to interview people both in good health and in poor. Your interview will give the Department a better understanding of how ALL people in your neighborhood are doing.

## Burden

## Q: How long will this take again?

A: The length of the survey depends on how you answer certain questions, but it takes about 25 minutes for most people.

## Privacy

Q: I'm unlisted, how did you get my phone number?
A: The phone numbers being called are generated randomly using a computer that produces all possible phone numbers in the County. This ensures that every County resident has the chance to be called. The computer can even dial unlisted numbers.
A: We don't get the numbers from the telephone book, but rather the computer randomly generates all of the numbers that we call. Because of this, we call both published and unpublished phone numbers.

Q: I'm on the state and national "Do Not Call" list. Why are you calling me?
A: Signing up for the "Do Not Call" registry prevents telemarketers who are trying to sell something from calling you. We are not selling anything. We are calling to conduct a legitimate research study for the LA County Department of Health, thus the "Do Not Call" registry is not applicable to us.

## Privacy: Location Information

Q: Why do you need my address or cross-streets?
A: Since LA County is so large and diverse, the Department of Public Health is interested in grouping respondents into smaller geographic areas to better assess the health and well-being at local levels in order to address ways to improve their lives. Please know that this information will be held in the strictest of confidence and will NOT be shared beyond the research team.

## Confidentiality

Q: Are my responses going to be confidential?
A: Your answers are confidential. You don't have to give me any personal identifying information such as your full name or address. Your information is handled in a secure and confidential manner.

Q: Why do you need to know how many adults live in this household?
A: It is information used to select one member from your household to complete the interview. It is a simple random selection, like drawing numbers from a hat.

## Lack of interest

Q: Thanks, but I am not interested.
A: Many people say they are not interested, but once they get started, they end up enjoying the interview. The questions are all about your health and are easy to answer and you will make a contribution to helping other county residents.

Q: I already told you I'm not interested in your survey, why are you calling again?
A: I'm sorry for the inconvenience, but we'd like to talk to (you/selected respondent) one more time about the importance of this survey and to ask for (you/him or her) to participate. The design of this study does not allow us to replace anyone with another member of the household once he/she is chosen for the study. The LA County Health Department wants to make sure that people in your neighborhood are represented in the study.

## Check for Cell Survev -OR- If completed both Adult and Child Version

Q: How am I going to get the payment? How do I know you'll really send this?
A: We will mail you a $\$ 10$ check. Processing typically takes 4 to 6 weeks. If you do not receive your check after 6 weeks, you can leave a message for the Abt SRBI Project Director, Andrew Evans at 888-772-4269, extension 11214 and he will work with you to make sure that you receive your check.

Q: You told me this was confidential and I answered your questions, but now you are asking me for my full name and my address!
A: Your name and address will only be on the check, and are entirely separate from your answers. The Health Department will NOT have access to it.

Q: I don't feel comfortable giving you my address. Can I get it some other way? Can I just give you my initials instead?
A: Unfortunately, we can only mail it to you. The check can only be sent to your address, and your correct name is needed so you can cash or deposit it.

## Appendix II-B: Adult Survey Questionnaire

-Project \#30082 -- 2014 LOS ANGELES COUNTY HEALTH SURVEY (LACHS) - FINAL

- Adult Survey + Child Continuation -

## Introduction 1 (RDD VERSION ("stype"=1))

Hello. I'm $\qquad$ and I'm calling on behalf of your Los Angeles County Department of Public Health, whose role is to promote and protect the health of everyone who lives in Los Angeles County. The Department of Public Health is conducting an important survey of County residents.

May I please speak with any adult, 18 years of age or older, who resides in this household?
> ENTER APPROPRIATE DISPOSITION CODE.

## (NOW GO TO CS9.)

## Introduction 1 (CELL PHONE VERSION ("stype"=2))

Hello. I'm $\qquad$ and l'm calling on behalf of your Los Angeles County Department of Public Health, whose role is to promote and protect the health of everyone who lives in Los Angeles County. The Department of Public Health is conducting an important survey of County residents. If you qualify for the survey, we will pay you $\$ 10$ for completing it.

## > PROCEED WITH INTERVIEW

CS1. In order to ensure your safety l'd like to ask you, are you driving a car right now?

$$
\begin{aligned}
& 1=\mathrm{Yes} \\

## QUESTION N3, ASK ALL RESPONDENTS.

N3. On an average day, about how many sodas or sweetened drinks such as Gatorade, Red Bull or Sunny Delight do you drink? Do not include diet sodas or sugar-free drinks. Please count a 12-ounce can, bottle or glass as one drink.
[INTERVIEWER: If Resp says only drinks soda/sweetened drinks 0 to 1 a day, a few times a week, few times a month, occasionally, code as "97" (Less than 1 a day/Rarely).

COUNT JUICE UNLESS IT'S 100\% FRUIT JUICE]

99=Refused)

## SUBSAMP=3 (ASK IF SUBSAMP=3, ELSE GO TO SUBSAMP 2 (N6)).

NN4 How safe would you say the regular tap water is for drinking in your community - not too safe, somewhat safe or very safe?

1 = Not too safe
2 = Somewhat safe
3 = Very safe
8 = (VOL) Don't Know
$9=(\mathrm{VOL})$ Refused
P8. Which of the following sources of water do you drink at home? Only tap water which includes water that has been treated or filtered in your home; Only bottled water or delivered water; Or both tap water and bottled water?

```
1 = Only tap water
2 = Only bottled/delivered water
3 = Both
4 = Other
\(5=(\mathrm{VOL})\) Do not drink water at home
\(8=(\mathrm{VOL})\) Don't Know
\(9=(\mathrm{VOL})\) Refused
```

PN9. Do you think fluoride in the drinking water is beneficial for adult and children's teeth?

1 = Yes
$2=\mathrm{No}$
8 = (VOL) Don't Know
9 = (VOL) Refused

## SUBSAMP=2 (ASK IF SUBSAMP=2, ELSE GO TO HEALTH CONDITIONS).

N6. I am going to read some statements about nutrition-related issues and, for each, please tell me whether you agree or disagree.
(insert item) Do you agree or disagree?

## N6 Answer Codes

1 = Strongly Agree
2 = Somewhat Agree
3 = Somewhat Disagree
4 = Strongly Disagree
$8=(\mathrm{VOL})$ Don't Know
$9=(\mathrm{VOL})$ Refused

## (Randomize items)

a I would support a tax increase on sodas as a way to discourage kids and others from drinking too many of them.
b There should be restrictions placed on the advertising of sugared cereals, candy, sodas, and fast foods to children.
cn I would support requiring kids' meals that include toys to meet health nutrition standards
en Supermarkets should be prohibited from selling unhealthy food items, like candy and soda, in their checkout aisles.

## INTRODUCTION 2

We are calling to collect information about the health of children to help the Department better serve the needs of all children in Los Angeles County. Your telephone number was randomly generated by a computer. We are definitely NOT selling anything or asking for money. The survey is absolutely confidential and the answers given will not be associated with your children or your household in any way. This is a public health survey sponsored by your Los Angeles County Department of Public Health. If you have any questions about the survey, you may contact the Los Angeles County Department of Public Health at (213) 240-7785.

1 = CONTINUE

## QUALIFIED LEVEL =1

SC1. Is your household located in Los Angeles County?
$1=$ Yes
$2=$ No
$8=(\mathrm{VOL})$ Don't Know
$9=(\mathrm{VOL})$ Refused
(IF SC1=1, GO TO C80.
ELSE ASK SC1a.)
SC1a. In what city or town do you live? (ENTER CITY CODE FROM TACKUP)
(RANGE=1 through 482; 997=Other; 998=Don't Know; 999=Refused)
$\qquad$ Enter City Code
(IF A CITY ON THE LIST IS GIVEN AT SC1a, GO TO SC2.
IF SC1a = OTHER, DON'T KNOW, OR REFUSED, TERMINATE ("S/O SC1a - NOT in LA
County") AND SAY: "I'm sorry but you are not eligible for this survey. We are only
interviewing people who currently live in Los Angeles County. Thank you for your time.")
C80. What is your current ZIP code?
$1=$ Gave Response (All Zip Codes must begin with a " 9 ")
$8=(\mathrm{VOL})$ Don't Know
$9=(\mathrm{VOL})$ Refused

CATI: CREATE VARIABLE BSCHH=0. (This variable uses the zip code to predict which households live in a BSC.) REFER TO "LACHS_BSC_Zip_Codes_CATI.xIsx" IF THE ZIP CODE IS LISTED, THEN BSCHH=1.

SC2. How many children live in your household who are...(insert item)?
$\qquad$ \# of Children (RANGE=0 through 20; 98=Don't Know; 99=Refused)
a. 12 to 17 years old
b. 6 to 11 years old
c. 5 years of age or YOUNGER
(Programmer: Create a variable called "totchild" which is the sum of SC2a/SC2b/SC2c.
IF "fproj"=30082c OR 30082I, use "totchild" data that was collected from Q78a /Q78b / Q78c.)
IF (SC2a=1 through 20) and (SC2b=98 OR 99) and (SC2c=98 OR 99), set "totchild" to answer from SC2a.
IF (SC2a=98 OR 99) and ((SC2b=1 through 20) and (SC2c=98 OR 99)), set "totchild" to answer from SC2b.
IF (SC2a=98 OR 99) and (SC2b=98 OR 99) and (SC2c=1 through 20), set "totchild" to answer from SC2c.
IF (SC2a=1 through 20) and (SC2b=1 through 20) and (SC2c=98 OR 99), set "totchild" to sum of SC2a/ SC2b.
IF (SC2a=1 through 20) and (SC2b=98 OR 99) and (SC2c=1 through 20), set "totchild" to sum of SC2a/ SC2c.
IF (SC2a=98 OR 99) and (SC2b=1 through 20) and (SC2c=1 through 20), set "totchild" to sum of SC2b/ SC2c.
(IF "totchild">0, GO TO SC2v.
IF ("totchild"=0) OR (98 OR 99 TO ENTIRE SC2 series), TERMINATE ("S/O SC2 - No Children Under 18") AND SAY: "I'm sorry but you are not eligible for this survey. We are only interviewing households with any children under 18 years of age. Thank you for your time.")

SC2v. I just want to confirm that there (is / are) a total of (insert sum of SC2a/SC2b/SC2c) (child / children) under 18 in your household.
-- (insert from SC2a if O through 20) that (is / are) 12 to 17 years old
-- (insert from SC2b if 0 through 20) that (is / are) 6 to 11 years old
-- (insert from SC2c if 0 through 20) that (is / are) 5 years of age or YOUNGER
Is this correct, or did I enter any of your answers INCORRECTLY?
1 = All answers are correct
2 = One or more answers are INCORRECT
$9=(\mathrm{VOL})$ Refuses to confirm answers
(IF SC2v=1, GO TO "INSTRUCTIONS FOR RANDOM SELECTION OF CHILD.". IF SC2v=2, GO READ DISPLAY BELOW THEN GO BACK TO SC2a.
IF SC2v=9, DISPOSITION AS REFUSAL.)

Display: I will now need to go back and re-ask some questions.

$$
1 \text { = CONTINUE }
$$

## INSTRUCTIONS FOR RANDOM SELECTION OF CHILD

(Programmer: IF "totchild" $=1$, SELECT THAT CHILD, THEN GO TO R1.
IF "totchild">1 AND BSCHH=1 AND THERE IS A CHILD 0-5 (SC2c>0), ALWAYS SELECT A 0-5 CHILD FOR THE INTERVIEW. IF THERE IS MORE THAN ONE 0-5 CHILD, RANDOMLY SELECT ONE OF THE 0-5 CHILDREN.

```
IF "totchild">1, RANDOMLY SELECT 1 CHILD FROM AMONGST ALL CHILDREN GIVEN AT Q78a/Q78b/Q78c OR Sc2a/SC2b/SC2c.
```

## VARIABLES NEEDED FOR SELECTION"

1) CREATE A VARIABLE CALLED "AGE GROUP" TO SHOW THE GROUP FROM WHICH THE CHILD WAS SELECTED. > USE THE FOLLOWING TEXT FOR READ-INS THROUGHOUT THE SURVEY:

$$
\begin{array}{ll}
>\text { "12 to 17"" } & \text { (if selected from Q78a / SC2a) } \\
>\text { "" to 11"" } & \text { (if selected from Q78b / SC2b) } \\
>\text { "0 to 5" } & \text { (if selected from Q78c / SC2c) }
\end{array}
$$

2) CREATE A VARIABLE CALLED "POSITION" TO INDICATE WHICH CHILD WAS SELECTED FROM WITHIN THE AGE GROUP. > IF THERE WAS ONLY 1 CHILD FROM THE "AGE GROUP" THAT WAS SELECTED, THEN "POSITION" SHOULD BE LEFT BLANK.
> IF THERE WAS MORE THAN 1 CHILD FROM THE "AGE GROUP" THAT WAS SELECTED, USE THE FOLLOWING TEXT TO INDICATE WHICH CHILD WAS SELECTED:
```
> "Oldest"
> "2\mp@subsup{2}{}{nd}}\mathrm{ Oldest"
> "3'd Oldest"
> ETC
```

## NOW GO TO R1.)

R1. We would like to ask some questions about the health and daily routines of (IF "totchild" $=1$, read: "the child under age 18 who lives in this household")(IF "totchild">1, read: "the (insert "position") child who is between the ages of (insert age group) who lives in this household") (IF ADULT SURVEY (30082c OR 30082I) OR CELL CHILD SUPPLEMENT (30023sc), insert: "As a way of reimbursing you for your time, we will pay you $\$ 10$ once you have completed the new survey.) ## Appendix III-D: Adult Sample Raking to Population Control Totals

## RAKING WITH TRIMMING WEIGHT BY INDIVIDUAL AND GLOBAL CAP VALUE METHOD

Sample size of completed interviews: $\mathbf{8 0 0 8}$
Raking input weight adjusted to population total: COMPOSITE_WT_ATPT
Mean value of raking input weight adjusted to population total: $\mathbf{9 6 5 . 0 1}$
Minimum value of raking input weight: $\mathbf{1 5 . 8 0}$
Maximum value of raking input weight: 7203.48
Coefficient of variation of raking input weight: $\mathbf{0 . 8 2}$
Global low weight cap value (GLCV): $\mathbf{9 6 . 5 0}$
Global low weight cap value factor: Mean input weight times . 1
Global high weight cap value (GHCV): 9650.09
Global high weight cap value factor: Mean input weight times 10
Individual low weight cap value (ILCV) factor: Respondent's weight times . 2
Individual high weight cap value (IHCV) factor: Respondent's weight times 5
Number of respondents who have an individual high weight cap value less than the global low weight cap value
(GLCV used in weight trimming): $\mathbf{1 3}$
Number of respondents who have an individual low weight cap value greater than the global high weight cap value (GHCV used in weight trimming): $\mathbf{0}$

\section*{Appendix III-G: Raking Results for Subsample 1}

\section*{Raking With trimming Weight by individual and global cap value method}

Sample size of completed interviews: 1002
Raking input weight adjusted to population total: COMPOSITE_WT_ATPT
Mean value of raking input weight adjusted to population total: \(\mathbf{7 7 1 2 . 3 7}\)
Minimum value of raking input weight: \(\mathbf{1 2 8 . 2 0}\)
Maximum value of raking input weight: \(\mathbf{3 8 9 6 8 . 5 6}\)
Coefficient of variation of raking input weight: \(\mathbf{0 . 8 4}\)
Global low weight cap value (GLCV): \(\mathbf{7 7 1 . 2 4}\)
Global low weight cap value factor: Mean input weight times . 1
Global high weight cap value (GHCV): 77123.68
Global high weight cap value factor: Mean input weight times 10
Individual low weight cap value (ILCV) factor: Respondent's weight times . 2
Individual high weight cap value (IHCV) factor: Respondent's weight times 5
Number of respondents who have an individual high weight cap value less than the global low weight cap value
(GLCV used in weight trimming): \(\mathbf{2}\)
Number of respondents who have an individual low weight cap value greater than the global high weight cap value
(GHCV used in weight trimming): \(\mathbf{0}\)

Appendix III-K: Child Sample Raking to Population Control Totals
}

\section*{RAKING WITH TRIMMING WEIGHT BY INDIVIDUAL AND GLOBAL CAP VALUE METHOD}

Sample size of completed interviews: 5982
Raking input weight adjusted to population total: CHILD_COMPOSITE_WT_ATPT
Mean value of raking input weight adjusted to population total: \(\mathbf{3 9 1 . 3 8}\)
Minimum value of raking input weight: \(\mathbf{0 . 6 3}\)
Maximum value of raking input weight: \(\mathbf{1 0 1 9 9 . 3 2}\)
Coefficient of variation of raking input weight: \(\mathbf{2 . 1 0}\)
Global low weight cap value (GLCV): \(\mathbf{3 5 . 6 2}\)
Global low weight cap value factor: Mean input weight times . 091
Global high weight cap value (GHCV): 4305.18
Global high weight cap value factor: Mean input weight times 11
Individual low weight cap value (ILCV) factor: Respondent's weight times . 167
Individual high weight cap value (IHCV) factor: Respondent's weight times 6
Number of respondents who have an individual high weight cap value less than the global low weight cap value
(GLCV used in weight trimming): \(\mathbf{2 5 9}\)
Number of respondents who have an individual low weight cap value greater than the global high weight cap value
(GHCV used in weight trimming): \(\mathbf{0}\)

Global high weight cap value (GHCV): \(\mathbf{4 0 8 2 . 3 0}\)
Global high weight cap value factor: Mean input weight times \(\mathbf{1 0}\)
Individual low weight cap value (ILCV) factor: Respondent's weight times . 20
Individual high weight cap value (IHCV) factor: Respondent's weight times 5
Number of respondents who have an individual high weight cap value less than the global low weight cap value
(GLCV used in weight trimming): \(\mathbf{2}\)
Number of respondents who have an individual low weight cap value greater than the global high weight cap value (GHCV used in weight trimming): \(\mathbf{0}\)

\section*{07:43 05OCT2015}

\section*{Appendix III-M: Household Subsample 5 and 6 Raking to Population Control Totals}

\section*{RAKING WITH TRIMMING WEIGHT BY INDIVIDUAL AND GLOBAL CAP VALUE METHOD}

Sample size of completed interviews: 2001
Raking input weight adjusted to population total: ADULT_HH_WT_2_ATPT
Mean value of raking input weight adjusted to population total: \(\mathbf{1 6 3 3 . 7 4}\)
Minimum value of raking input weight: \(\mathbf{3 2 . 9 3}\)
Maximum value of raking input weight: \(\mathbf{2 2 1 9 8 . 7 2}\)
Coefficient of variation of raking input weight: \(\mathbf{1 . 1 9}\)
Global low weight cap value (GLCV): \(\mathbf{1 6 3 . 3 7}\)
Global low weight cap value factor: Mean input weight times . 10
Global high weight cap value (GHCV): \(\mathbf{1 6 3 3 7 . 3 7}\)
Global high weight cap value factor: Mean input weight times \(\mathbf{1 0}\)
Individual low weight cap value (ILCV) factor: Respondent's weight times . 20
Individual high weight cap value (IHCV) factor: Respondent's weight times 5
Number of respondents who have an individual high weight cap value less than the global low weight cap value
(GLCV used in weight trimming): \(\mathbf{0}\)
Number of respondents who have an individual low weight cap value greater than the global high weight cap value
(GHCV used in weight trimming): \(\mathbf{0}\)

\section*{Appendix III-N: Child Survey Household Sample Raking to Population Control Totals}

\section*{RAKING WITH TRIMMING WEIGHT BY INDIVIDUAL AND GLOBAL CAP VALUE METHOD}

Sample size of completed interviews: 5982
Raking input weight adjusted to population total: CHILD_HH_WT_1_ATPT
Mean value of raking input weight adjusted to population total: \(\mathbf{1 8 9 . 4 4}\)
Minimum value of raking input weight: 7.96
Maximum value of raking input weight: \(\mathbf{2 2 2 8} .77\)
Coefficient of variation of raking input weight: \(\mathbf{1 . 1 8}\)
Global low weight cap value (GLCV): \(\mathbf{1 7 . 2 4}\)
Global low weight cap value factor: Mean input weight times . 091
Global high weight cap value (GHCV): \(\mathbf{2 0 8 3 . 8 9}\)
Global high weight cap value factor: Mean input weight times 11
Individual low weight cap value (ILCV) factor: Respondent's weight times . 167
Individual high weight cap value (IHCV) factor: Respondent's weight times 6
Number of respondents who have an individual high weight cap value less than the global low weight cap value
(GLCV used in weight trimming): \(\mathbf{0}\)
Number of respondents who have an individual low weight cap value greater than the global high weight cap value
(GHCV used in weight trimming): \(\mathbf{0}\)

\title{
Appendix III-0: BSC Child Sample Raking to Population Control Totals
}

\section*{RAKING WITH TRIMMING WEIGHT BY INDIVIDUAL AND GLOBAL CAP VALUE METHOD}

Sample size of completed interviews: 700
Raking input weight adjusted to population total: CHILD_POP_WT_ATPT
Mean value of raking input weight adjusted to population total: \(\overline{\mathbf{2} 25.99}\)
Minimum value of raking input weight: 9.23
Maximum value of raking input weight: \(\mathbf{3 7 3 7 . 0 1}\)
Coefficient of variation of raking input weight: \(\mathbf{2 . 0 0}\)
Global low weight cap value (GLCV): \(\mathbf{2 0 . 5 6}\)
Global low weight cap value factor: Mean input weight times . 091
Global high weight cap value (GHCV): \(\mathbf{2 4 8 5 . 8 7}\)
Global high weight cap value factor: Mean input weight times 11
Individual low weight cap value (ILCV) factor: Respondent's weight times . 167
Individual high weight cap value (IHCV) factor: Respondent's weight times 6
Number of respondents who have an individual high weight cap value less than the global low weight cap value
(GLCV used in weight trimming): \(\mathbf{0}\)
Number of respondents who have an individual low weight cap value greater than the global high weight cap value
(GHCV used in weight trimming): \(\mathbf{0}\)

A Hierarchy of List-Assisted Stratified Telephone Sample Design Options. 1993 Proceedings of the Section on Survey Research Methods. Alexandria, VA: American Statistical Association, pp. 982-987.

[^1]:    ${ }^{3}$ Mosher, M., \& Best, J. (2013). Attempting to Boost RDD Cell Sample Productivity by Identifying Non-working Numbers Prior to Dialing. Paper presented at American Association of Public Opinion Research Conference. Boston, MA.
    ${ }^{4}$ Dutwin, D. (2013). Cellular Telephone Methodology: Sampling, Dialing and Dispositioning. American Association of Public Opinion Research Short Course. Boston, MA.
    ${ }^{5}$ A total of 8,056 Adult interviews were conducted, but 48 cases were determined to reside outside of LA County in the geocoding process and were dropped from the data.
    $12 \mid \mathrm{P}$ age

[^2]:    ${ }^{6}$ Since the cellular sample was drawn, newer geographic targeting options have become available (using individual switch centers or tower usage), although these options are still fairly ineffective at targeting small areas and can have steep coverage tradeoffs for higher incidence.

[^3]:    ${ }^{7}$ A total of 6,030 Child interviews were completed, but 48 cases were determined to reside outside of LA County by the geocoding process and were dropped from the data.

[^4]:    ${ }^{8}$ Blumberg SJ, Luke JV. Wireless substitution: Early release of estimates from the National Health Interview Survey, July-December 2012. National Center for Health Statistics. June 2013.

[^5]:    ${ }^{9}$ July 10: After discussing the use of decimal time versus minutes and seconds with LA DPH, Abt SRBI agreed to include the minutes and seconds timing as well.

[^6]:    ${ }^{10}$ All times are Pacific.

[^7]:    ${ }^{11}$ While our dialer was programmed to display the LADPH number for all landline calls made using the automated dialer, the telephone number actually displayed on an individual's caller ID is controlled by the local telephone operator, and in some cases may have reflected the actual number used to place the call instead of the LADPH number.

[^8]:    ${ }^{12}$ For the initial LACHS geocoding, Abt SRBI used WGS84 projection coordinate system.

[^9]:    ${ }^{13}$ http://www.aapor.org/AAPORKentico/AAPOR_Main/media/publications/Standard-
    Definitions2015 8theditionwithchanges April2015 logo.pdf

[^10]:    ${ }^{14}$ Before adjusting the base sampling weight for the number of working cell phones used by adults in the household, it was necessary to create variables related to the presence of a landline telephone in the household, cell mostly status, and type of telephone service in the household. These variables are documented in Appendix III-H and Appendix III-I.
