Los Angeles County
Injury Hospitalization Fact Sheet
2000-2006

Total Number of Hospitalizations in Los Angeles County
- An average of 66,897 per year.

Injury Mechanism and Intent
- Over half of all injury-related hospitalizations were from falls (41%) and motor vehicle traffic collisions (12%).
- Unintentional injuries (accidents) accounted for 84% of hospitalizations.
- Nearly three quarters (73.4%) of suicide attempts were caused by poisonings.

Age
- 81 year olds had the highest number of hospitalizations compared to any other age
- Average age of injury-related hospitalization patient was 50.6 years.
- Los Angeles County residents 65 and older have a rate of 2372.2 per 100,000 for unintentional injury-related hospitalizations.
- Unintentional injury-related hospitalizations were three times higher among 65+ residents compared to any other age group.
- Assault and suicide attempt rates were highest among 15-24 year olds.
- Average age of hospitalized assault victim was 31.7 years.
- Average age of hospitalized suicide attempt victim was 35.7 years.
- Average age of hospitalized legal intervention victim was 39.1 years.
- Average age of hospitalized undetermined intent victim was 42.0 years.
- Average age of hospitalized undetermined intent victim was 53.5 years.

Gender
- Males accounted for 53% of all injury-related hospitalizations.
- 86% of assault related injury hospitalizations were among males.
- 59% of suicide hospitalizations were among females.
- 57% of all poisoning hospitalizations were among females.

Race/Ethnicity
- 46% of injury-related hospitalizations were among Whites.
- 34% of injury-related hospitalizations were among Latinos.
- 12% of injury-related hospitalizations were among Blacks.
- 8% of injury-related hospitalizations were among Asians/Others.
- Whites and Blacks were both overrepresented among injury-related hospitalizations compared to the overall county population.
- Among race/ethnicity, Latinos were the youngest with an average hospitalization age of 38.6 years and Whites were the oldest at 60.6 years.
Injury hospitalizations for Whites were highest among fall-related injuries.
Blacks and Latinos were overrepresented among firearm-related hospitalizations.

**Service Planning Area (SPA)**
- Overall injury hospitalization rates were highest in the South SPA (SPA 6) and lowest in the San Gabriel Valley (SPA 3).
- The San Fernando Valley (SPA 2) had the highest number of overall injury hospitalizations while the Antelope Valley (SPA 1) had the fewest.
- The Antelope Valley (SPA 1) had the highest motor vehicle traffic-related injury hospitalizations.
- The West SPA (SPA 5) accounted for the highest (51%) overall percentage of fall-related hospitalizations in the County.
- The South SPA (SPA 6) accounted for 38% of all firearm hospitalizations.

**Medical Charges**
- Injury-related hospitalization medical charges have dramatically increased almost doubling from $25,540 in 2000 to $47,430 in 2006.
- Suffocation injuries from choking or strangling were the most expensive injuries to treat, averaging more than $85,000 per hospitalization.
- Fire/burn injuries were the second most costly averaging over $60,000 per hospitalization.
- Poisoning, environmental causes and overexertion treatment charges averaged the lowest at under $25,000 per hospitalization.
- Intentional injuries from assaults were higher in medical charges averaging $47,416 per hospitalization, while suicide attempts averaged the least per visit at roughly $21,103.
Falls-Related Hospitalizations
Fact Sheet 2008

Falls were the leading cause of injury-related hospitalizations in Los Angeles County from 2000-2006
- An average of 27,000 hospitalizations resulting from falls was reported during each of these years.
- From 2000-2005 there were 75 fall related hospitalizations for every fall related fatality in LAC.
  - In 2006 the average charge of a fall-related hospitalization was $43,678.

Age
- Average age of person hospitalized for a fall-related injury was 64 years.
- Fall-related hospitalizations peaked among people in their late 70’s or early 80’s.
- Hospitalizations for falls from bed were highest among 0-5 and 70+ years.
- Among people 35+, falls were the number one cause of injury related hospitalizations.

Gender
- More women were hospitalized for unintentional (59%) falls while men were from undetermined (74%), assault (65%), or intentional (41%) intents.

Race/Ethnicity
- Hospitalizations for fall-related injuries by race/ethnic group were Whites (56%), Latinos (27%), Blacks (8%), and Asian/Other (9%).
- Average age of hospitalized fall victims was 72 years for Whites, 67 years for Asians/Others, 58 years for Blacks and 50 years for Latinos.

Geography
- The lowest fall-related hospitalization rate was found in SPA 3, San Gabriel Valley and SPA 8, South Bay.
- The highest fall-related hospitalization rate was reported in SPA 4, Metro.

Most hospitalizations were the result of unintentional falls due to tripping, stumbling, or other activities causing a loss of balance.

Types of Falls, 2000-2006:

<table>
<thead>
<tr>

Motor vehicle traffic (MVT) collisions were the 2nd leading cause of injury-related hospitalizations in Los Angeles County from 2000-2006

- An average of 8,300 hospitalizations from MVT collisions were reported from 2000-2006.
- From 2000-2005 there were 9.6 MVT-related injury hospitalizations for every MVT-related fatality in Los Angeles County.
  - In 2006, the average charge of a MVT-related hospitalization was $67,309.

### Age

- MVT-related hospitalizations peaked among 19 year olds and people 80-84 years old.
- Injury hospitalizations for MVT collisions were highest among 18-24 year olds and lowest among the 80+ age group.
- Children 1-14 years old had higher rates of pedestrian injury hospitalizations than any other type of MVT collision.

### Gender

- Males accounted for 61% of all MVT-related hospitalizations.
- Occupant injuries were fairly evenly divided between males (53%) and females (47%); nearly all bicyclist (88%) and motorcycle (91%) collisions involved males.

### Race/Ethnicity

- Hospitalizations for MVT-related injuries by race/ethnic group were Latinos (43%), Whites (34%), Blacks (13%), and Asian/Other (10%).

### Geography

- The highest MVT collision hospitalizations rate was reported in SPA 1, Antelope Valley.
- The lowest MVT collision hospitalization rates were in SPA 3, San Gabriel Valley, and SPA 5, West.

### From 2000-2006 most hospitalizations were the result of unintentional MVT collisions. Only 144 (0.2%) were classified as suicide attempts, assaults, or of undetermined intent.

Poisoning-Related Hospitalizations
Fact Sheet 2008

Poisonings were the 3rd leading cause of injury-related hospitalizations in Los Angeles County from 2000-2006
- An average of 6,374 hospitalizations from poisonings were reported from 2000-2006.
- From 2000-2005 there were 9 hospitalizations for every poisoning-related fatality in Los Angeles County.
- In 2006 the average charge of a poisoning injury-related hospitalization was $26,896.

Age
- Poisoning-related hospitalization rates were lowest among children 14 years and younger.
- The average age of a person hospitalized for poisoning was 41.7 years.
- Adults 85-89 years old had the highest rate of poisoning injury hospitalizations than any other age group.

Gender
- Women accounted for 57% of all poisoning hospitalizations. Most were of unintentional (52%) and intentional (65%), compared to men who were more often of undetermined (54%) intent.

Race/Ethnicity
- Hospitalizations for poisoning-related injuries by race/ethnic group were Whites (48%), Latinos (30%), Blacks (14%), and Asian/Other (8%).
- Average age of hospitalized poisoning victims was, 34.6 years for Latinos, 41.8 years for Asians/Others, 43.0 years for Blacks and 45.8 years for Whites.

Geography
- The highest poisoning-related hospitalizations rate was in SPA 1, Antelope Valley.
- The lowest poisoning hospitalization rates were in SPA 7, East and SPA 3, San Gabriel Valley.

Struck By or Against Hospitalizations
Fact Sheet 2008

Struck injuries were the 5th leading cause of injury-related hospitalizations in Los Angeles County from 2000-2006

- An average of 3,200 hospitalizations from struck injuries was reported during each of these years.
- There were 187 struck injury hospitalizations for each fatal struck injury from 2000-2005.
- The average charge for a struck hospitalization nearly doubled from 2000 ($18,336) to 2006 ($34,402).

Age
- The average age of a person hospitalized with a struck injury was 36.3 years.
- The rate of struck injury hospitalizations was highest among 85+ year olds.
- The rate of unintentional injuries peaked among 65+ year olds, but the rate of assault injuries peaked among 20-24 year olds.
- Those with sports-related injuries averaged 23.9 years old while those with injuries from striking against furniture averaged 53.4 years old.

Gender
- Males accounted for 79% of all struck injury hospitalizations, 89% of sports-related injuries, and 85% of assault injuries.

Race/Ethnicity
- The rate of struck injury hospitalizations among Blacks was more than twice as high as that of any other racial/ethnic group.
- Blacks accounted for 12% of unintentional injuries and 27% of assaults, while Whites accounted for 37% of unintentional injuries and 24% of assaults.

Geography
- The South SPA (SPA 6) had the highest struck injury hospitalization rate.
- The San Gabriel SPA (SPA 3) had the lowest struck injury hospitalization rate.

Struck injury hospitalizations were fairly evenly divided between unintentional injuries (53%) and assaults/legal intervention (47%).

Cut/pierce injuries were the 7th leading cause of injury-related hospitalizations in Los Angeles County from 2000-2006

- An average of 3,068 hospitalizations from struck injuries was reported during each of these years.
- There were 30 cut/pierce injury hospitalizations for each cut/pierce fatality from 2000-2005.
- The average charge for a cut/pierce hospitalization increased from 2000 ($18,646) to 2006 ($30,987).

Age
- The average age of a person hospitalized with a cut/pierce injury was 34.5 years.
- People with unintentional injuries were the oldest (37.6 years) and those with undetermined intent injuries were the youngest (29.9 years).
- The greatest number of cut/pierce hospitalizations and the highest hospitalization rate were both found among people in their late teens and early twenties.

Gender
- Males accounted for 74% of all cut/pierce hospitalizations, including 90% of assaults, 76% of unintentional, 52% of undetermined intent and just 49% of suicide attempt injuries.

Race/Ethnicity
- The rate of cut/pierce hospitalizations among Asians/Others was less than half that of any other racial/ethnic group.
- Whites accounted for 14% of assaults and 48% of suicide attempts, while Latinos accounted for 34% of suicide attempts and 59% of assaults.

Geography
- The highest cut/pierce hospitalization rate was in SPA 6, the South.
- The lowest hospitalization rate was in SPA 5, the West.

All intentional and 60% of unintentional injuries were caused by other or unspecified objects.

Firearm injuries were the 9th leading cause of injury-related hospitalizations in Los Angeles County from 2000-2006

- An average of 2,088 hospitalizations from firearm injuries was reported during each of these years.
- There were 1.8 firearm injury hospitalizations for each fatal firearm injury from 2000-2005
- The average charge for a firearm hospitalization increased from 2000 ($43,116) to 2006 ($76,590).

Age
- The average age of a person hospitalized with a firearm injury was 26.0 years.
- People injured in suicide attempts were the oldest (39.8 years) and those with assault injuries were the youngest (25.5 years)
- More than half of all patients hospitalized with a firearm injury were 15-24 years old.
- Hospitalization rates peaked among 18-19 year olds.

Gender
- Males accounted for 92% of all firearm hospitalizations, including 92% of assaults, 91% of undetermined intent, 90% of unintentional & legal intervention, and 83% of suicide attempt injuries.

Race/Ethnicity
- The hospitalization rate for Blacks was 3.7 times the rate for Latinos and more than 10 times the rate for Whites or Asian/Others.

Geography
- The South (SPA 6) had highest firearm injury hospitalization rate.
- The West (SPA 5) had the lowest firearm injury hospitalization rate.
- The South (SPA 6) accounted for 38% of all firearm injury hospitalizations, but only 10% of the county’s population.

Injuries from BB guns, air guns, and paintball guns are classified as “other specified injuries” rather than firearm injuries.

Natural and Environmental Hospitalizations
Fact Sheet 2008

Natural injuries were the 10th leading cause of injury-related hospitalizations in LA County from 2000-2006

- An average of 1,369 hospitalizations from natural injuries was reported during each of these years.
- There were 93 natural injury hospitalizations for each fatal natural injury from 2000-2005.
- The average charge for a natural hospitalization increased from 2000 ($15,977) to 2006 ($28,988).

Age
- The average age of a person hospitalized with a natural injury was 42.7 years.
- Generally, hospitalization rates increased with age, peaking among 90+ year olds.
- Patients hospitalized for excessive heat or cold were, on average, more than 60 years old.
- Other animal injuries accounted for less than half the hospitalizations among 65+ years old, but more than 75% of hospitalizations among 1-9 year olds.

Gender
- Males accounted for 54% of all natural hospitalizations, including 66% for excessive heat, 65% from venomous plants/animals, and 78% of suicide attempt & undetermined intent injuries.

Race/Ethnicity
- Hospitalization rates were highest among Whites and Blacks, lower for Hispanics, and much lower for Asians/Others.

Geography
- The San Fernando (SPA 2) had the highest natural injury hospitalization rate.
- The West (SPA 5) had the lowest hospitalization natural injury rate.

Spiders are responsible for 57% of venomous plant/animal injuries.
