

Novel Coronavirus (COVID-19)

Los Angeles County Department of Public Health Guidance for Pregnancy and Postpartum Care

Recent updates:

9/28/20: This guidance has been updated from the June 23, 2020. Changes, highlighted in yellow below, reflect new science concerning COVID-19 and pregnancy risks, a new list of COVID-associated symptoms, and an update concerning the period of time required in isolation before an infected person may return to work.

NOTE: This document may be updated as additional information and resources become available. Updates here are highlighted in yellow. Check the Los Angeles County Department of Public Health website: <http://www.ph.lacounty.gov/media/Coronavirus/> for updates to this document.

There is a lot more to learn about infection with the novel coronavirus in pregnancy, but the Los Angeles County Department of Public Health (DPH) wants to share the best information we have now so you can make good decisions about your own care and keep yourself and your baby healthy.

Key Points

1. Take extra care to avoid getting sick while you are pregnant.
2. While there is much we don't know, emerging evidence suggests that there may be an increased risk of non-fatal serious illness due to COVID-19 in pregnant women. (Other risk factors for severe disease include older age, diabetes, hypertension, and obesity.) Studies have also suggested a potential link between COVID-19 and preterm birth.¹
3. Even though we do not fully understand the risks of the virus, most people who have become sick during pregnancy so far have gone on to have babies that do not show any signs of harm.
4. Mothers who are infected with COVID-19 can breastfeed. If you are sick, you can take simple steps so your baby does not become sick.

Special Concerns in Pregnancy

- Pregnant people are at higher risk than other people from diseases caused by infection. This is due to the various changes that people experience in their bodies while they are pregnant. There is no evidence so far that pregnant people are becoming infected with COVID-19 more often than other people, but we don't know enough to say for sure. So, it makes sense to be extra careful.
- One symptom of the COVID-19 infection can be fever. We do not know just how much of a risk fever is for human babies, but it makes sense not to take chances. If you are pregnant and experience symptoms of COVID-19, make sure you call your OB-GYN or health care provider early.

How to Minimize Risk

Practice everyday personal protection practices. Do all the things everyone should do to avoid catching the virus, but with a little extra care:

Novel Coronavirus (COVID-19)

Los Angeles County Department of Public Health Guidance for Pregnancy and Postpartum Care

- Stay home. Avoid contact with people who are sick. Avoid any crowded, indoor space.
 - If you are an essential employee and must continue working, ask your employer about teleworking or flexing your hours so you are traveling and at work when there are fewer people around.
 - Talk to your doctor or healthcare provider about your prenatal or postpartum visits. They may be able to use telehealth for some of your visits, or schedule visits when their office is not crowded.
- Have food delivered to your home so you can avoid crowded grocery stores.
 - Ask family or friends or rely on a commercial delivery service to bring food to you.
 - If you are enrolled in WIC, ask your WIC program if you can participate without having to come into the WIC office and if you can have food delivered to your home.
- Take extra care with infection control. Remember that people who do not show ANY signs of being ill may carry the virus. Any one in a public space may carry the virus on their hands and may transmit virus when they sneeze, cough or even talk loud. This is even true of family member if they go out into public spaces. Make sure all household members take just as much care as you do.
 - Wash hands often with soap and water for at least 20 seconds, especially after blowing your nose, coughing, or sneezing, or using the restroom.
 - Wash your hands after touching surfaces in public places.
 - Avoid touching objects or surfaces, then touching your mouth, nose, or eyes before washing your hands. If you have to touch your face, wash your hands before and after.
 - If soap and water are not available, use a hand sanitizer that contains at least 60% alcohol.
 - To the extent possible, avoid touching high-touch surfaces in public places – elevator buttons, door handles, and handrails.
 - Be more aware and practice respiratory etiquette, such as sneezing into a tissue or covering your cough by using your elbow.
 - Clean and disinfect your home to remove germs: practice routine cleaning of frequently touched surfaces (for example: tables, doorknobs, light switches, handles, desks, toilets, faucets, sinks & cell phones).
 - Avoid crowds, especially in poorly ventilated spaces. Your risk of exposure to respiratory viruses like COVID-19 may increase in crowded, closed-in settings with little air circulation if there are people in the crowd who are sick.
 - Avoid cruise travel and non-essential air travel.

What to do if You Get Sick while Pregnant

- Prepare in advance for this possibility. Make sure you will be able to manage if you get sick.
 - Symptoms of COVID-19 are listed below. Review them carefully and make sure you have a plan for home care should you experience any of the symptoms on the list.
 - Ask your doctor what over-the-counter medications would be safest for you to take if you got sick, and then make sure to have those products on hand, along with tissues and anything else you will need.
 - Consult your medical provider about the need for testing and isolation if you experience any of these symptoms or other symptoms that are severe or concerning to you.

Novel Coronavirus (COVID-19)

- If you get sick:
 - Symptoms of COVID-19 may include the following: fever or chills, cough, shortness of breath or difficulty breathing, fatigue, muscle or body aches, headache, sore throat, nausea or vomiting, diarrhea, congestion or runny nose, or new loss of taste or smell.
 - This list of symptoms is not all inclusive. Consult your medical provider about the need for testing and isolation for these or any other symptoms that are severe or concerning to you.
 - You may want to contact both your regular doctor and your obstetrician/ midwife in case they have any special guidance to keep your pregnancy safe.
 - If you need to self-isolate, stay home for at least 10 days from when your symptoms first appeared AND at least 24 hours after you have recovered. “Recovered” means that your fever has gone without the use of medications and your symptoms (such as cough and shortness of breath) have improved.
 - Most pregnant people who have gotten sick from COVID-19 have not had to go to the hospital, so if you get sick you will probably be able to stay home. Take care of yourself as you would with a cold or the flu: rest, drink liquids, use over-the-counter medications that your doctor recommends to control fever.
 - If you get help from a home visitor, a doula, WIC or any other pregnancy support program, call ahead and let them know you are sick and ask for help with home food delivery and other needs. You can also turn to them for emotional support if getting sick while you are pregnant is getting you down.
 - Get medical attention immediately if your condition gets worse. Signs to look for are:
 - Difficulty breathing
 - Pain or pressure in the chest
 - Bluish color of lips
 - New onset of confusion or difficulty waking up
 - Any other serious symptoms

If any of these things occur, call 911 or go to an emergency room, otherwise call your doctor before going in to seek care.

When the Baby Comes

- Some hospitals are limiting entry by anyone other than patients and staff. As a result, you may be limited in who can be with you at the time of delivery. You may have to choose between a partner and a birth attendant, for example. Do check on the policy at your hospital and modify your plans if you need to. You may be able to have a second person “with” you by using Skype or Facetime or another online option.
- Limits on visitors will also apply once the baby is born. This is to protect other hospital patients and staff, but it is also to protect you and your baby. Let family and friends know what the rules are and make arrangements to connect in other ways.
- If you are infected at the time of delivery, current guidelines call for doctors to proceed with whatever type of delivery (vaginal or c-section) was already planned, unless there is some other reason to make

Novel Coronavirus (COVID-19)

a change in plans. Your hospital may, however, take extra precautions to keep you, the baby, and healthcare staff safe during the delivery. These may include:

- Limiting the number of people who can stay with you or visit you.
- Discharging you from the hospital as soon as possible.
- Having your baby in a separate room from you.
- Taking extra care that you wash your hands and wear a mask before holding the baby.
- Upon hospital discharge and once you are home with your newborn:
 - You, the baby, and anyone who was with you in the hospital should stay at home for fourteen (14) days, even if you have had no symptoms of illness. Do not let anyone come visit you or the baby for those 14 days. It is especially important to put off visits by relatives over age 65, who are at greater risk for getting very sick from COVID-19. It can be hard not to see a new grandbaby right away, but it is the healthiest choice for everyone.
 - It is also very normal to need help caring for a newborn and while recovering from childbirth. If anyone (partner, family member, friend, doula) does help you care for yourself and the baby, make sure you both are hand washing, wiping down all surfaces, and practicing physical distancing (staying 6 feet apart) as much as possible. It is ideal if anyone caring for you and the newborn stays for an extended period, as opposed to going in and out of the home repeatedly.
 - Family members confirmed with COVID-19 should be separate from you and practice isolation.

Things to know about breastfeeding

- Breast milk provides protection against many illnesses and is therefore important for your baby. In fact, as in almost all cases, breastmilk is the best food you can give your baby.
- If you are trying to breastfeed while you are sick:
 - Wash your hands before touching the baby.
 - Wear a surgical face mask if possible, while feeding at the breast.
 - If expressing breast milk with a breast pump, wash your hands before touching any pump or bottle part and get instructions from hospital staff about cleaning the pump after each use.
 - If possible, consider having someone who is not sick feed the expressed breast milk to the infant.
- There are many breastfeeding support services and groups online and by phone, from your clinic, hospital, and lactation consultants and doulas. Please first try to get support virtually before going anywhere in person.

Stay Positive!

- Use your social supports.
 - Stay connected by phone or Internet to friends and family and ask them for help with food needs, caring for older children and emotional support
 - Build and maintain your virtual community
 - Enlist the help of your partner or the baby's father.
- Expect to recover without lasting harm and to have a healthy baby.
