Frequently Asked Questions

1. What is the JYNNEOS monkeypox vaccine?

JYNNEOS is a 2-dose vaccine that is approved by the Food and Drug Administration (FDA) for the prevention of monkeypox and smallpox disease in people ages 18 years and over. It also has FDA emergency use authorization (EUA) for people under age 18.

- If the JYNNEOS vaccine is given before a person is exposed to monkeypox, it helps to protect them from getting monkeypox disease.
- If it is given soon after they are exposed to monkeypox (ideally within 4 days), it may help to prevent the disease or make it less severe.

Note: If a person already has symptoms of monkeypox, it is too late for them to get the vaccine. They should see a doctor for testing and advice about treatment.

The JYNNEOS vaccine is made using a vaccinia virus. This is a virus that is related to the monkeypox and smallpox viruses. The vaccinia virus is weakened so that it cannot cause vaccinia, smallpox, or monkeypox in the person getting vaccinated or the people around them.

A vaccine called ACAM2000 is approved by the FDA to prevent smallpox but can also be used to prevent monkeypox. As ACAM2000 is not being used to prevent monkeypox in the US at this time, this FAQ only refers to the JYNNEOS vaccine.

2. How is the vaccine given?

The JYNNEOS vaccine is given by injection. There are two different methods that are used:

- **Subcutaneous injection.** This means that the vaccine is given beneath the skin in the upper arm. This method is used for people who are younger than age 18 and people of any age who have had keloid scars. A keloid scar is a thick, raised scar that can form after skin damage, such as a cut, piercing, or surgery.

- **Intradermal injection.** This means that the vaccine is given between the layers of skin. This method is used for most people ages 18 years and older. People getting the vaccine this way may choose one of 3 places to get this injection: on the forearm (inside of the arm between the wrist and the elbow); on the upper back below the shoulder blade; and on the deltoid (shoulder muscle). You can see pictures of people getting the vaccines on the forearm, upper back, or shoulder.

Currently, the intradermal method is being used for most people ages 18 and older. However, if you have a concern for keloid scarring or you strongly prefer getting the vaccine subcutaneously, you can receive it. Be sure to tell the vaccine provider your preference.

3. How many doses do I need?

The JYNNEOS vaccine is given as two doses at least 4 weeks apart. A person will start to build protection in the days and weeks after their first dose but will not have their maximum protection until two weeks after the second dose. This is when you are considered fully vaccinated.

It is still important to continue to take other steps to reduce your risk even after you are fully vaccinated.
4. How well does the vaccine work?

We do not yet have enough real-world data to say how well the vaccine protects people from getting monkeypox during this current outbreak. However, a recent study by the CDC showed that for every 1 infection among people who received one dose of JYNNEOS vaccine, there were 14 infections among people who did NOT receive vaccine. Older data from Africa suggest that JYNNEOS vaccine is at least 85% effective in protecting people against monkeypox when the vaccine is given before an exposure.

Vaccination may prevent someone who has been exposed to monkeypox from getting the disease if it is given within 4 days of the exposure. If the person is vaccinated between 4 and 14 days after the exposure, the vaccine is less likely to prevent infection, but if the person does get monkeypox, their symptoms may be milder.

The vaccine is not known to work if it is given once a person already has symptoms of monkeypox.

Because we are still learning how well the vaccine works during this outbreak, it is important to continue to take other steps to reduce your risk even after you are fully vaccinated.

5. Who should get vaccinated?

Vaccination is recommended for people who have been exposed to monkeypox and people who may be at current or future risk to get monkeypox.

The following people are eligible for vaccine:

- Any man or transgender person who has sex with men or other transgender people
- People of any gender or sexual orientation who engage in commercial and/or transactional sex (e.g., sex in exchange for money, shelter, food, or other goods or needs) or have sex in association with a large public event
- People living with HIV, especially persons with uncontrolled or advanced HIV disease
- People who had skin-to-skin or intimate contact with someone with suspected or confirmed monkeypox, including those who have not yet been confirmed by Public Health
- Sexual partners of people in any of the above groups
- People who anticipate being in any of the above groups
- People with certain jobs including:
  - People who work with orthopoxviruses or tests for orthopoxviruses in research or clinical laboratories
  - Health care workers who care for people with confirmed or suspected monkeypox. This includes clinicians and environmental services personnel. See FAQ below I’m a healthcare worker. Should I get vaccinated?

More people may become eligible for vaccine in the future. For the latest information, see ph.lacounty.gov/monkeypox/vaccine.htm.

6. What are the side effects of JYNNEOS?

Side effects at the site of injection are common with both subdermal and intradermal JYNNEOS vaccination. These include redness, swelling, soreness, firmness, and/or itching. These symptoms are more common with intradermal injections. For some people, the itching and swelling can last days to
several weeks. Other side effects can include muscle pain, headaches, nausea, chills, or feeling tired. There is a small chance of fever.

As with any medicine, there is a very small chance of a vaccine causing a severe allergic reaction. If you have signs of a severe allergic reaction (such as hives, swelling of the face or throat, difficulty breathing, a fast heartbeat, or dizziness), call 911 immediately or go to the nearest hospital. For other concerns, contact a healthcare provider.

**7. Can I get the vaccine at the same time as other vaccines?**

Yes. The JYNNEOS vaccine may be given before, after, or at the same time as other vaccines. This includes flu and COVID-19 vaccines.

If you are a 12–39 year old male, you might consider waiting 4 weeks after you get a JYNNEOS vaccine before getting a COVID-19 vaccine. This is because there may be a small increase in the risk of myocarditis (inflammation of the heart muscle) if you get the vaccines close together. But, if you are at high risk for getting monkeypox or had a recent exposure, you should get your JYNNEOS vaccine even if you recently got a dose of COVID-19 vaccine.

**8. I’m a healthcare worker. Should I get vaccinated?**

The risk of monkeypox transmission is very low for healthcare workers (HCW) if they follow appropriate infection control practices. This includes wearing personal protective equipment (PPE) and using safe specimen collection methods. However, HCWs who care for people with confirmed or suspected monkeypox are eligible for vaccine. This includes HCWs who are likely to collect laboratory specimens from people with monkeypox (e.g., HCW working in sexual health clinics or clinical settings that serve at risk populations).

Staff who only administer the JYNNEOS vaccine but do not care for people with confirmed or suspected monkeypox are not eligible for monkeypox vaccination.

Postexposure prophylaxis (PEP) may be recommended for healthcare workers after certain occupational exposures. See CDC [high and intermediate risk exposure chart](https://www.cdc.gov/monkeypox/vaccination/post-exposure.html).

**9. If I have symptoms of monkeypox, should I get vaccinated?**

No. If you have symptoms of monkeypox you should not get a monkeypox vaccine. Talk to a doctor about your symptoms as soon as possible. If you do not have a doctor or health insurance, you can visit a Public Health [sexual health clinic](https://www.lacity.org/health). For more information, call the Public Health Call Center at 1-833-540-0473 (7 days a week 8:00am – 8:30pm).

**10. I already had monkeypox, should I get vaccinated?**

No. Based on currently available information, if you have had monkeypox, you are protected from getting it again. You have “natural immunity”. Vaccination is not recommended at this time. However, if you are immunocompromised, you should speak to your physician about whether you should get vaccinated.
### 11. If I get monkeypox after getting the first dose of vaccine, should I get the second dose?

After you have had monkeypox, based on currently available information, you are protected from getting it again. This means you don’t need to get a second dose. If you are immunocompromised (you have a weak immune system), talk to your doctor about whether you should get a second dose.

### 12. If I had a smallpox vaccine years ago, should I still get a monkeypox vaccine?

Yes. People who were vaccinated for smallpox before this outbreak should still get the monkeypox vaccine. This is because protection from the smallpox vaccine may lessen over time.

### 13. Can I get the vaccine if I have a weakened immune system and/or HIV?

Yes. It is important to get vaccinated as people with weak immune systems, such as people with advanced or uncontrolled HIV, are at higher risk of becoming seriously ill if they get monkeypox. JYNNEOS has been studied in people with HIV, and no severe adverse reactions were seen.

It is important to note that if you have a weakened immune system, you may be less likely to build a strong immune response after vaccination. This means that it is especially important to take other steps to keep from getting monkeypox.

### 14. Can I get the vaccine if I have eczema?

Yes, JYNNEOS has been studied in people with atopic dermatitis (eczema), and no severe adverse reactions were seen. People with these conditions may have more severe disease if they do develop monkeypox.

### 15. Should I get the vaccine if I am pregnant or might be pregnant?

If you are pregnant and have been exposed to MPOX, it is strongly recommended that you consider getting vaccinated. This is because monkeypox virus can be transmitted to the fetus during pregnancy or to the newborn by close contact during and after birth. Preterm delivery, miscarriage, stillbirth, and monkeypox infection in the baby have all been reported after people got monkeypox when they were pregnant. It is not known how often this happens or might happen during this current outbreak. Data on the risks of JYNNEOS vaccination during pregnancy are limited. If you have questions about vaccination, talk to a provider. The sooner after you are exposed the better the vaccine is likely to work.

### 16. Can I get the vaccine if I am breast or chestfeeding?

If you are exposed to monkeypox and are breast/chestfeeding, you should be vaccinated. Data is not yet available on the effects of JYNNEOS in breastfed infants or on milk production. It is also unknown whether JYNNEOS is passed through human breast milk. But because the vaccine does not contain a virus that replicates, getting vaccinated cannot give monkeypox to your baby.
17. My first dose was subcutaneous (beneath the skin). How will my second dose be given?

If you are age 18 or over, you will be offered the second dose intradermally (between the layers of skin) to complete the two-dose series (see How is the vaccine given? above). However, if you have a concern for keloid scarring or if you strongly prefer to receive the second dose through the subcutaneous route, then the second dose can be given subcutaneously.

18. Can I get my second dose subcutaneously (beneath the skin) if I turn 18 after getting my first dose?

Yes. Once you turn 18, the vaccine is usually given intradermally (between the layers of the skin). But if you have a concern for keloid scarring or if you strongly prefer the subcutaneous route instead, you can get the vaccine subcutaneously. Be sure to tell the vaccine provider your preference.

19. Do I need to get consent from my parents to get vaccine?

At Public Health sites, if you are between the ages of 12-17, you can consent to receive the vaccine by signing this form. At these sites, if you are under the age of 12, you must be accompanied by a parent, legal guardian, or a responsible adult. You must also have this consent form signed by your parent or legal guardian.

20. Where can I get more information?

- Los Angeles County Department of Public Health (LAC DPH) Monkeypox webpage [ph.lacounty.gov/Monkeypox Vaccine page](ph.lacounty.gov/Monkeypox)
- Food and Drug Administration (FDA) Fact sheet for recipients and caregivers (for intradermal vaccination and people under age 18)
- Centers for Disease Control (CDC) JYNNEOS Vaccine – What you need to know Vaccine Information Statement (for subcutaneous vaccine for people age 18 and over)
- CDC Monkeypox vaccine webpage
- California Department of Public Health (CDPH) Monkeypox vaccine webpage
