Introduction

Improved public health, medical care, and prevention efforts have contributed to dramatic increases in life expectancy in the United States over the past century. The leading causes of death have shifted from infectious diseases to chronic diseases and degenerative illnesses (Table 1). In LA County, where the average life expectancy has reached a high of 80.3 years, the aging population is becoming more racially and ethnically diverse, and women are living longer than men.

Although our population’s longevity is a monumental achievement, with advancing age, risk for chronic health conditions and disability increases. Women’s increased longevity can result in more years lived in poor health or with lower quality of life. Health conditions such as osteoporosis (a disease of low bone mass that increases risk for falls and fractures), Alzheimer’s disease, and late complications of diabetes, heart disease, and stroke become more common later in life. These conditions are particularly expensive to treat in the long-term and can greatly burden caregivers and the health care system. The cost of providing health care for Americans age 65 years and older is at least 3 to 5 times greater than the cost of care for those younger than 65 years; these costs are projected to increase 25% by 2030.

Poor health is not an inevitable consequence of aging, and many diseases that affect women as they grow older, such as heart disease, diabetes, osteoporosis, and arthritis, have origins at younger ages. Many conditions can be prevented or mitigated by engaging in health-promoting behaviors earlier in life. These behaviors, which include eating a healthy diet, engaging in regular physical activity, and not smoking, can significantly help reduce the risk for chronic diseases and many of the leading causes of death. Even among women already affected by chronic conditions, adopting healthy behaviors can reduce disease symptoms and improve well-being.

Emerging evidence suggests that the benefits of a healthy lifestyle extend beyond having a healthy body, to improving the health of the brain. We can maintain independence and help prevent cognitive decline as we grow older by remaining active and nurturing mental health through continued social and civic engagement. In addition, we can preserve

---

dignity and comfort at the end of life by addressing difficult, but important, decisions about end-of-life care sooner rather than later, and by discussing these decisions with our loved ones.\(^7\)

**Who are the Aging Women of LA County?**

As the baby boomer generation (those born between 1946 and 1964) starts reaching age 65 in 2011, women will comprise an increasing majority of aging Angelenos.\(^1,3,8\) For this generation of women, life has changed dramatically over the last several decades. Family structures have become more varied, with more women heading their households, working outside the home, and delaying child-bearing or not having children.\(^9\)

- In 2000, two-thirds of adult women in LA County were 18-49 years old, but by the year 2050, only half of adult women will be under 50 (Figure 1).
- The proportion of adult women age 65 years and older will nearly double during the same 50 years.

- While the number of women age 50 and older will increase in all racial and ethnic groups except whites by 2050, the rate of increase is expected to vary dramatically among different populations (Figure 2).

- In 2000, 26% of women ages 50 and older were Latina, and 49% were non-Latina white. By 2050, the percent of Latinas ages 50 and older in LA County will more than double to 56%, while the percent of white women will decrease to 17%.
- By 2050, the percentage of Asian/Pacific Islander women 50 and older is expected to increase slightly, while the percentage of older African American women is expected to decrease by half. The relative decline in aging black women, like the decline in aging white women, reflects the proportionate increase in the population of aging Latinas.

---

The Growing Burden of Chronic Conditions

The 2007 Los Angeles County Health Survey (LACHS) asked respondents if they had ever been told by a doctor or health care professional that they have any of the following 5 chronic conditions: depression, diabetes, heart disease, high cholesterol, and hypertension. While the prevalence of other important diseases (e.g., arthritis, dementia, etc.) was not ascertained, these 5 conditions contribute to many of the leading causes of death and premature death.

- The percent of adult women with chronic conditions increases with age. While 64% of women under 50 have not been diagnosed with any of these conditions, only 17% of women 65 years and older reported not being diagnosed with any of them (Figure 4).

- The number of co-occurring chronic conditions also increases with women's age: 11% of 18-49 year olds, 40% of 50-64 year olds, and 53% of women 65+ years reported being diagnosed with 2-5 of these chronic conditions.

Disparities in Life Expectancy

- On average, women in LA County live about 5 years longer than men.2

- While life expectancy for women has increased, racial/ethnic disparities persist: the life expectancy for an African American baby girl is only 78 years, while that for an Asian/Pacific Islander baby girl is 87 (Figure 3).

- Life expectancy for white women and Latinas falls in between, at 83 and 85 years, respectively.

Disparities in life expectancy among these groups of women may reflect the conditions in which people live, including their health behaviors and social and physical environments, as well as their physical and mental health.

†† Life Expectancy estimates were calculated by the Data Collection and Analysis Unit, Office of Health Assessment and Epidemiology, LA County Department of Public Health.

† Chronic conditions included in analysis were depression, diabetes, heart disease, high cholesterol, hypertension.
Among women 65+ years racial/ethnic disparities are evident: a higher percentage of African American women reported being diagnosed with one or more chronic conditions (93%) than Latinas (85%), white women (82%) and Asian/Pacific Islander women (80%) (Figure 5).

In LA County...

- Women 50-64 years of age reported higher rates of obesity10 (27%) and cigarette smoking (14%) than women of other age groups (Figure 6).

- Although women 65+ years of age reported lower rates of obesity (17%) and cigarette smoking (7%), they reported higher rates of minimal to no physical activity (57%) compared to women of other age groups.

- African American women and Latinas reported higher rates of obesity (34% and 31%, respectively) compared to whites (16%) and Asians/Pacific Islanders (4%) (Figure 7).

- Smoking rates were higher among African American and white women (20% and 14%, respectively) compared to Latinas and Asian/Pacific Islander women (7% and 3%*, respectively).

### Aging Well: Modifiable Risk Factors

Poor diet and physical inactivity (the root causes of obesity), along with cigarette smoking, are common risk factors for many chronic conditions, and for the majority of the leading causes of death and premature death in LA County and in the United States. More than one third of US deaths in 2000 were attributed to at least one of these risk factors.1,3 By maintaining healthy behaviors throughout the lifespan, women can drastically decrease their risk for chronic conditions and live well into their old age.

10. Weight status is based on Body Mass Index (BMI) calculated from self-reported weight and height. According to NHLBI clinical guidelines, a BMI < 18.5 is underweight, a BMI ≥ 18.5 and < 25 is normal weight, a BMI ≥ 25 and < 30 is overweight, and a BMI ≥ 30 is obese. [REFERENCE: National Heart, Lung, and Blood Institute (NHLBI) www.nhlbi.nih.gov/guidelines/obesity/obesity.pdf]
Women with 2-5 chronic conditions reported higher rates of obesity, physical inactivity, and smoking (Figure 8).

Health-Related Quality of Life

Poor health is NOT an inevitable consequence of aging, and having good quality of life should be the expectation, not the exception.\(^1,3,4\) The LACHS measured quality of life by asking respondents the number of days in the last month in which their mental health was not good (poor mental health days) and their physical health was not good (poor physical health days).

- Women age 50-64 reported more poor mental health days in the past month than did younger and older women.
- As women aged, they reported more poor physical health days (Figure 9).

| Health-Related Quality of Life for Women in LA County and by Age Group, LACHS 2007 |
|---|---|---|---|---|---|---|---|
| Poor Mental Health Days | Poor Physical Health Days |
| Total | 3.4 | 3.7 | 3.2 | 2.5 | 4.3 | 5.3 | 2.9 | 6.2 |
| 18-49 Years | 3.4 | 3.7 | 3.2 | 2.5 | 4.3 | 5.3 | 2.9 | 6.2 |
| 50-64 Years | 3.4 | 3.7 | 3.2 | 2.5 | 4.3 | 5.3 | 2.9 | 6.2 |
| 65+ Years | 3.4 | 3.7 | 3.2 | 2.5 | 4.3 | 5.3 | 2.9 | 6.2 |

* Estimate should be viewed with caution (RSE ≥ 23%)

\(\dagger\) Chronic conditions included in analysis were depression, diabetes, heart disease, high cholesterol, hypertension.
• Women with more chronic conditions reported more poor mental and poor physical health days (Figure 10).

Recommendations

What Can Individuals Do?

• Remain physically active: walking at least 30 minutes a day, 10 minutes at a time, can improve cardiovascular health and overall fitness. Balancing and stretching exercises can help reduce falls and maintain flexibility.

• Eat a healthy diet rich in fruits and vegetables, whole grains, and low-fat proteins like lean meats, fish, and poultry.

• Obtain preventive screenings and immunizations as recommended by your health care professionals.

• If you smoke, seek help to quit by calling 1-800-NO-BUTTS for free assistance and support.

• Manage stress and have a strong support system; stay engaged with family and friends; participate in social and cultural events.9

What Can Communities and Cities Do?

• Prepare for the anticipated increase in the number of aging women by addressing community needs and gaps in aging services.1,11

• Establish community and public health programs that focus on preventing chronic disease, injury, and disability.9,11

• Improve the health and functional independence of all women by facilitating healthy behaviors:
  ◆ Increase access to safe parks and recreation areas.
  ◆ Promote the availability of healthy foods, especially in low-income neighborhoods.
  ◆ Create smoke-free environments.

• Employ community strategies to increase the number of places where older adults can receive clinical preventive services, to increase the use of these potentially life-saving measures.11

• Raise awareness among health professionals about the need for early detection of symptoms of dementia or Alzheimer’s.

• Provide education on decision making related to end-of-life planning (e.g., promoting use of advance directives).11

What Can Policymakers Do?

• Provide more home- and community-based services that will allow individuals to remain in their homes as they get older (aging in place).

• Help aging adults maintain their connection with the community through:
  ◆ Funding of social support services and demonstration projects for older adults.
  ◆ Provision of one-stop care and Adult Day Health Care Centers, especially in underserved communities.
  ◆ Funding for initiatives that promote research on evidenced-based interventions that help older women manage chronic disease, maintain quality of life, and delay long-term care placement.

• Develop policies and strategies to address the needs of those with cognitive impairment, and their caregivers.11

• Address the shortage of physicians, nurses, social workers, researchers, and other professionals in gerontology and geriatrics:
  ◆ Recruit students to pursue careers in gerontology and senior health; and
  ◆ Offer incentive programs such as loan repayment or tuition relief to retain and foster careers in these disciplines.
