Understanding Marijuana
Marijuana Use is Common

- Marijuana is the most commonly used illicit drug in the U.S.
- Any use among general population age 12+ in past month:
  - 2011: 7%
  - 2008: 5.8%
- Use is most common among people age 18-25 (19% of population)
- 48% of adults in the US report having used marijuana at some time in their life

Why Do People Use Marijuana?

Among people who used marijuana in the past year:

- For Fun: 47%
- For Medical Reasons: 30%
- For Fun and for Medical Reasons: 23%

Monitoring the Future 2013

As Perceived Harm Drops, Use Goes Up

1993: 26.0% Using
2003: 26.6% Using
2013: 19.5% Using

Perceived Harm

Marijuana: What is it?

- Dry, shredded mix of leaves, flowers, stems, and seeds, usually from *Cannabis sativa* or *Cannabis indica* plant
- Both are common subspecies of the hemp plant, which is common throughout the world
- Contains over 400 chemical compounds
- Common names: grass, weed, pot, reefer, Mary Jane, ganja

SOURCE: SAMHSA, 2012 (reference list).
Marijuana growers have worked to make the drug **as potent as possible**.

In 1960s-70s average THC concentrations were 1-2%. Today, they are **as high as 20%**.

<td>Hallucinations (in large doses)</td>
</tr>
</tbody>
</table>

- Effects can vary by strains
  - *Sativa*: More euphoria, stress relief
  - *Indica*: Relaxation, physical (especially pain) relief
  - *Sativa* and *Indica* often combined, leading to variable effects

**Sources**: NIDA 2012a;b (reference list).

</tr>
</tbody>
</table>

Marijuana: Other Forms

• Hashish
  – Compressed resin of cannabis plant
  – More concentrated and potent than marijuana plant

• Hash Oil (“Wax”)
  – Psychoactive chemicals extracted from cannabis plant with butane
  – Three to four times as potent as marijuana plant

• Synthetic Cannabinoids (“Spice”, “K2”)
  – Mimic some of the effects of marijuana, in increased severe symptoms

Marijuana: How Does it Work?

- Contains over 60 cannabinoids: main active chemical is Δ-9-tetrahydrocannabinol (THC)
- Stimulates “high” by triggering receptors in parts of brain that influence pleasure, memory, thinking, concentration, coordination
- THC’s molecular structure is similar to that of neurotransmitters that affect cannabinoid receptors (affect pain, appetite, vomiting reflex)
- Effects generally last 1-4 hours

Marijuana and the Brain

https://www.youtube.com/watch?v=oeF6rFN9org
Neurologic Impact of Marijuana in Adults

- Administered neuropsychological tests to 63 current heavy cannabis users who had smoked cannabis at least 5,000 times in their lives and to 72 control subjects who had smoked no more than 50 times in their lives.
- Differences between the groups after 7 days of supervised abstinence were reported. However, no deficits were found after 28 days abstinence, after adjusting for various potentially confounding variables.
- Suggest that cognitive deficits associated with long-term cannabis use are reversible and related to recent cannabis exposure.

Neurologic Impact of Marijuana

• When cannabis users were asked to rate the effects of their own cannabis use as positive, neutral, or negative, they gave overwhelmingly negative ratings of the effects that cannabis had had on their

  social life (70%):
  physical health (81%): 
  mental health (60%): 
  cognition (91%): 
  memory (91%): 
  career (79%): 

Neurologic Impact of Marijuana

- It seems a reasonable hypothesis that the negative effects these long-term heavy cannabis users reported are due to being acutely intoxicated every day.
- Cannabis intoxication results in impairments in cognitive, perceptual, and psychomotor tasks. Tasks showing the most impairment involve short-term memory, sustained or divided attention, complex decision-making, and reaction time.
- Ninety-seven percent of the heavy users reported driving on a regular basis while intoxicated. Studies using driving simulators show marked impairment during acute cannabis intoxication, and a disproportionate number of accidents occur in individuals intoxicated with cannabis and alcohol.

Marijuana and the Adolescent Brain

- Human studies suggest early onset (prior to 16-18 yo) associated with more severe cognitive consequences.
  - Poorer attention
    (Ehrenriech et al., 1999)
  - Executive functioning
    (sustained attention, cognitive inhibition, abstract reasoning)
    (Fontes et al., 2011)

(Lisdahl and Price., 2012)
Marijuana and the Adolescent Brain

- Longitudinal research demonstrates that early onset marijuana use associated with lower IQ
  - Drop from childhood “average” to adult low “average”
  - Never achieved predicted adult IQ trajectory even with sustained abstinence in adulthood (Meier et al., 2012)

- Overall studies suggest that regular adolescent MJ use may cause brain structural changes associated with
  - poor neuronal efficiency
  - poorer cognitive functioning (psychomotor speed, executive functioning, emotional control, and learning and memory) (Lisdahl et al., 2013)

- This may indelicate a large proportion of youth are experiencing cognitive difficulties that may negatively impact their performance, leading to increased school difficulty and reduced grades (Medina et al., 2007)
Marijuana: Negative Effects on Behavior and Mental Health

- Similar to alcohol/other drugs if misused (impairment)
- Long term use has negative impact on learning and memory
- Long term use reduces motivation (“amotivational syndrome”)
- Associated with mental health problems
  - Unclear if marijuana use is cause or effect
  - Heavy use is highly associated with serious mental illness – particularly among those with high risk (e.g., family history)

Marijuana: Negative Effects When Smoked

- Can lead to respiratory illness
  - One marijuana cigarette causes as many pulmonary problems as **4-10 tobacco cigarettes**
  - Increased risk for bronchitis, emphysema, lung cancer

- Can cause cardiovascular complications
  - Raises blood pressure & heart rate **20-100%**
  - **4.8 times risk** of heart attack in hour after use

Marijuana: Negative Effects in Pregnancy

• There is increasing evidence that prenatal exposure may result in:
  – Increased risk of motor, social, and cognitive disturbances.
  – Higher rate of low birth weight infants, and childhood leukemia

• Marijuana has been found in breast milk although levels are generally considered subclinical.

SOURCE: Texas Tech University, Health Sciences Center, 2013 (reference list).
Is Marijuana a Medicine?
Marijuana’s Medical Potential: Research Evidence

- Reduces nausea
- Stimulates appetite
- Pain relief
- Controls muscle pain, spasms
- Reduces tics (Tourette’s Syndrome)
- Reduces convulsions (epilepsy)

Marijuana’s Medical Potential: Ongoing Clinical Trials

• Studying potential of marijuana and marijuana-based medications to treat:
  – Multiple Sclerosis
  – High Heart Rate
  – Non-Cardiac Chest Pain
  – Chronic Obstructive Pulmonary Disease
  – Sickle Cell Disease
  – Spinal Cord Injury Pain
  – Inflammatory Bowel Disease (Crohn’s disease)
  – Liver Problems
  – Cancer-Related Pain
  – Brain Tumors
  – Dementia

• Many of these trials on individuals with multiple physical and/or mental health problems

Different Kinds of Marijuana-Based Medicine

• Botanical cannabis (plant): “Medical Marijuana”

• Synthetic THC medications available in U.S. for nausea/appetite stimulation:
  – Dronabinol (Marinol®) (FDA approved for HIV)
  – Nabilone (Cesamet®) (FDA approved for cancer; HIV off-label)

• Other medications not available in U.S.:
  – Nabiximols (Sativex®) THC/cannabidiol mouth spray for pain relief, muscle spasms; currently being investigated by FDA
  – Rimonabant (Accomplia®, Zimulti®) for treatment of obesity and nicotine dependence (selective cannabinoid receptor-1 blocker)
THC vs CBD

- CBD is contained in cannabis. Amounts vary by plant with some containing high CBD and almost no THC
- Non psychoactive and does not interfere with psychomotor function
- Reduces intoxicating effects of THC (e.g., memory, paranoia, drowsiness)
- Seems to produce a variety of medical effects
- Most studies have been in animals
- CDB, like all cannabinoids, is still illegal in most states
- Pharmaceutical versions are in development

### Effects of CBD

</tr>
<tr>
<td>All Symptoms</td>
<td>Marijuana slightly more effective</td>
</tr>
</tbody>
</table>

- Overall **slightly** more people living with HIV find marijuana more effective than other treatments; many prefer traditional treatment.
- There are risks associated with marijuana use for people living with HIV.

SOURCE: Corless et al., 2009 (reference list).
Summary

• Marijuana has psychogenic effects that are appealing to recreational users.
• The strength has increased 15 times from a decade ago.
• Addiction, including physical dependence, is possible and should be assessed for all users.
Summary

• Research has shown that marijuana does have some impact medically for some specific conditions
• Research is ongoing to determine utility for a variety of medical issues
• Research is focusing on THC and CBD to determine where the medical effect is coming from
